## Project Goals

$\square$ Design, implement, and analyze the parallel solution of interest on modern large-scale multiprocessor/multi-core systems.

- Getting Accustomed to real life high performance multiprocessor computing environment.
- Solve Matrix Multiplication Problem in Parallel and compare the results with a sequential implementation to comment on Amdahl's law.

## Amdahl's Law

$\square \quad$ The maximum speedup achievable by an $n$-processor machine is given by $S_{n} \leq 1 /[f+(1-f) / n]$, where $f$ is the fraction of operations in the computation that must be performed sequentially.
$\square$ So, for example, if five percent of the operations in a given computation must be performed sequentially, then the speedup can never be greater than 20, regardless of how many processors are used.

- Therefore, just a small number of sequential operations can significantly limit the speedup of an algorithm on a parallel machine.

## Problem Definition - Matrix Multiplication

Given a matrix $A(N \times N)$ and a matrix $B(N \times N)$, the matrix $C(N \times N)$ resulting from the multiplication of matrices $A$ and $B, C=A \times B$ is computed as Follows.

$$
c_{y}=\sum_{k=1}^{n} a_{k} \times b_{n}
$$

Note: To Compute One Value in C matrix, we have to peform N multiplications and ( $\mathrm{N}-1$ ) additions. Thus to compute the $\mathrm{N}^{\wedge} 2$ values in C Matrix, we have to peform $\mathrm{O}\left(\mathrm{N}^{\wedge} 3\right)$ operations.

## Sequential Algorithms

## Brute Force Algorithm

for ( $\mathrm{i}=0 ; \mathrm{i}<\mathrm{n} ; \mathrm{i}++$ )
for ( $\mathrm{j}=0 ; \mathrm{i}<\mathrm{n} ; \mathrm{j}++$ )
c[i][i] $=0$;
for ( $\mathrm{k}=0 ; \mathrm{k}<\mathrm{n} ; \mathrm{k}++$ )
$c[i][i]+=a[i][k]$ * $b[k][j]$ end for
end for end for

## Strassen's Improvised Algorithm

$$
\begin{aligned}
& {\left[\begin{array}{l|l}
a & b \\
c & d
\end{array}\right] X\left[\begin{array}{l|l}
e & f \\
g & h
\end{array}\right]=\left[\begin{array}{c|c}
a e+b g & a f+b h \\
c e+d g & c f+d h
\end{array}\right]} \\
& \text { A } \\
& \text { C }
\end{aligned}
$$

$A, B$ and $C$ are square metrices of size $N \times N$
$a, b, c$ and $d$ are submatrices of $A$, of size $N / 2 \times N / 2$
$\mathrm{e}, \mathrm{f}, \mathrm{g}$ and h are submatrices of B , of size $\mathrm{N} / 2 \times \mathrm{N} / 2$

## Sequential Algorithm - Runtime Analysis

| No of <br> Processors | Matrix <br> Dimension | Running <br> Time(s) |
| :--- | :--- | :--- |
| 1 | $100 \times 100$ | 3.36 |
| 1 | $300 \times 200$ | 30.49 |
| 1 | $400 \times 400$ | 228.93 |
| 1 | $500 \times 500$ | 440.95 |
| 1 | $700 \times 700$ | 1216.29 |
| 1 | $800 \times 800$ | 1839.21 |
| 1 | $900 \times 900$ | 2591.42 |
| 1 | $1000 \times 1000$ | 3612.70 |
| 1 |  | 833.29 |
| 1 |  |  |

## Block Striped Matrix Decomposition - A Parallel Approach

1. Divide A_matrix along its Rows as per Number of Processors
2. Divide B_matrix along its Columns as per Number of Processors
3. All Processors in Parallel loads A[rank] and B[rank]
4. For i in (rank,N):

C $[$ rank, i$]=\mathrm{A}$ _matrix[rank] *B_matrix[i]
send(rank,B_matrix[i])
B_matrix[i] = receive(rank)
5. For i in(0, rank):

C[rank,i] = A_matrix[rank] *B_matrix[i]
send(rank,B_matrix[i])
B_matrix[i] = receive(rank)
6. Write the Results of C
def send(rank,B):
if rank==0 : send $(B$, send $=N-1$, tag $=N-1)$
else: send(B,send = rank-1, tag= rank-1)
def receive(rank):
if rank==N-1:
B_matrix $=$ receive(source $=0$, tag $=$ rank $)$
else:
B_matrix = receive(source=rank+1,tag = rank)

## Data Distribution - After First Iteration

At Every step, each of the four processors compute the next block of C in their row in a cyclic fashion. To produce $C$, as depicted in the following slide.

## Start

| C11 |  |  |  |
| :--- | :--- | :--- | :--- |
|  | C22 |  |  |
|  |  | C33 |  |
|  |  |  | $\mathbf{C 4 4}$ |$\quad$|  |
| ---: |

| C11 | C12 |  |  |
| :---: | :---: | :---: | :---: |
|  | C22 | C23 |  |
|  |  | C33 | C34 |
| C41 |  |  | C44 |

At Every step, each of the fou processors compute the next block of C in their row in a cyclic fashion. The Number

## Result

| C 11 | C 12 | C 13 | C 14 |
| :--- | :--- | :--- | :--- |
| C 21 | C 22 | C 23 | C 24 |
| C 31 | C 32 | C 33 | C 34 |
| C 41 | C 42 | C 43 | C 44 |

| C11 | C12 | C13 |  |
| :--- | :--- | :--- | :--- |

## Parallel Approach (100 x 100 Data Items/ Processor)

| No of <br> Processors | Matrix Size | Running Time(s) |
| :--- | :--- | :--- |
| 1 | $100 \times 100$ | 3.36 |
| 4 | $200 \times 200$ | 4.58 |
| 16 | $400 \times 400$ | 13.65 |
| 64 | $832 \times 832$ | 30.77 |
| 256 | $1792 \times 1792$ | 65.34 |

## Scaled Speed-up Achieved (100 x 100 Data Items/ Processor)

| No of <br> Processors | Speed-up Achieved |
| :--- | :--- |
| 1 | 1 |
| 4 | 6.65 |
| 16 | 16.77 |
| 64 | 59.77 |

University at Buffalo The State University of New York

## Parallel Approach (200 x 200 Data Items/ Processor)

| No of <br> Processors | Matrix Size | Running Time(s) |
| :--- | :--- | :--- |
| 1 | $200 \times 200$ | 30.49 |
| 4 | $400 \times 400$ | 38.99 |
| 16 | $800 \times 800$ | 75.01 |
| 64 | $1600 \times 1600$ | 143.56 |
| 256 | $3328 \times 3328$ | 336.87 |

Sequential RunTime Vs Parallel Running Time (200x 200)per processor

University at Buffalo The State University of New York

## Parallel Approach (400 x 400 Data Items/ Processor)

| No of <br> Processors | Matrix Size | Running Time(s) |
| :--- | :--- | :--- |
| 1 | $400 \times 400$ | 228.93 |
| 4 | $800 \times 800$ | 444.03 |
| 16 | $1600 \times 1600$ | 973.56 |
| 64 | $3200 \times 3200$ | 1823.54 |
| 256 | $6400 \times 6400$ | 2574.67 |

Sequential RunTime Vs Parallel Running Time (400×400) per processor

University at Buffalo The State University of New York

## Parallel Approach (800 x 800 Data Items/ Processor)

| No of <br> Processors | Matrix Size | Running Time(s) |
| :--- | :--- | :--- |
| 1 | $800 \times 800$ | 1839.21 |
| 4 | $1600 \times 1600$ | 2481.57 |
| 16 | $3200 \times 3200$ | 4802.58 |
| 64 | $6400 \times 6400$ | 9919.36 |

## Speed up Factor while keeping Data Fixed (800 x 800)

## Quadrupling Data While Doubling No of Processors

| No of <br> Processors | Matrix Size | Running <br> Time(s) |
| :--- | :--- | :--- |
| 1 | $100 \times 100$ | 3.36 |
| 2 | $200 \times 200$ | 13.27 |
| 3 | $300 \times 300$ | 32.02 |
| 4 | $500 \times 400$ | 38.99 |
| 5 | $600 \times 600$ | 86.45 |
| 6 | $700 \times 700$ | 110.184 |
| 7 | $800 \times 800$ | 157.72 |
| 8 |  |  |

| No of <br> Processors | Matrix Size | Running <br> Time(s) |
| :--- | :--- | :--- |
| 9 | $900 \times 900$ | 181.445 |
| 10 | $1000 \times 1000$ | 228.20 |
| 16 | $2400 \times 2400$ | 2285.12 |
| 24 | $3200 \times 3200$ | 3646.03 |
| 32 | $10000 \times 10000$ | 23163.69 |
| 64 |  | 9919.36 |
| 100 |  |  |

## Reevaluation of Amdahl's Law

$\square$ Amdahl's Law overlooks the fact that for many algorithms, the percentage of required sequential operations decreases as the size of the problem increases and hence the speed up achieved will also increase with the size of the problem.

- However, this is not applicable for all problems. For problems such as Matrix multiplication, as the size of problem increases larger volume have data have to be communicated among processors and will affect the speed up factor after a point.
- To solve Matrix multiplication more effectively we need to come up with a better algorithm as well a better communication system among processors.

University at Buffalo The State University of New York

## Challenges Faced

$\square$ The Matrix dimensions should be completely divisible by Number of Processors.
D Doubling the Matrix dimension essentially means quadrupling the size of data.
$\square$ Thus No of Processors should also be quadrupled to achieve desired results.
$\square$ Matrix multiplication is a heavily communication dependant Problem and thus with increase in No of Processors/ data heavily affects the running Time.

## Questions ??
