## Sequential Algorithm

```
def FindPrime(n):
    prime = [True for i in range(n+1)]
    for i in range(2,n+1):
    for j in range(2,i):
        if i%j==0:
            prime[i]=False
            break
    prime[i] = True
```

Time complexity: $\mathrm{O}\left(\mathrm{n}^{\wedge} 2\right)$
$>$ The prime number is a positive integer greater than 1 that has exactly two factors, 1 and the number itself.
First few prime numbers are $2,3,5,7,11,13,17,19,23$
$\Rightarrow$ Except for 2, which is the smallest prime number and the only even prime number, all prime numbers are odd numbers.
$>$ Every prime number can be represented in form of $\mathbf{6 n + 1}$ or $\mathbf{6 n - 1}$ except the prime numbers $\mathbf{2}$ and $\mathbf{3}$, where n is any natural number.

- The Sieve of Eratosthenes is a method used to find prime numbers.
- Prime numbers are important in modern encryption algorithms like sha256 that keep our digital transactions safe.

## Sieve of Eratosthenes

- Public-key cryptography also uses prime numbers to create specialized keys.
- The Sieve is also used in mathematics, abstract algebra, and elementary geometry to study shapes that reflect prime numbers.
- Biologists use the Sieve to model population growth, and composers use prime numbers to create metrical music.
- Olivier Messiaen, a French composer, used prime numbers to create unique rhythms in his music pieces.

## Sieve Simulation

## Sequential Sieve Algorithm

| $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 7 | 8 | - | 10 | 11 | 12 |
| 13 | 14 | 15 | 16 | 17 | 18 |
| 19 | 20 | 21 | 22 | 23 | 24 |
| 25 | 26 | 27 | 28 | 29 | 30 |
| 31 | 32 | 33 | 34 | 35 | 36 |

find primes up to $\mathbb{N}$<br>For all numbers a : from 2 to sqrt(n)<br>IF a is unmarked $\mathbb{T H E N}$ a is prime For all multiples of a $(a<n)$ mark multiples of as composite<br>All unmarked nummbers are prime!

Pseudo code

Time complexity: $\mathrm{O}\left(\mathrm{n}^{*} \log (\log (\mathrm{n}))\right)$

## Parallel Sieve Implementation

$>$ Split the array of length n between threads p each of size $\mathrm{n} / \mathrm{p}$.
> Utilize the \#pragma omp parallel for directive to concurrently set the 'prime' array as 'True.' This directive distributes the workload among multiple threads for each array segment, enhancing efficiency.
$>$ Simultaneously, multiple threads are employed to eliminate the non-prime multiples within the range of 2 to the square root of ' $n$.' This parallelization accelerates the process of finding prime numbers.
$>$ Upon identifying the prime numbers in each thread, tally the count of primes from every thread and consolidate the results using \#pragma omp parallel for reduction(+:primeCount).
> The master thread is responsible for displaying the final outcome, streamlining the presentation of prime numbers found through parallel computation.

## Marking array as True

| Thread 1 | $\mathbf{0}$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ |
| :--- | :--- | :--- | :--- | :--- |
| Thread 2 | 4 | 5 | 6 | 7 |
| Thread 3 | 8 | 9 | 10 | 11 |
| Thread 4 | 12 | 13 | 14 | 15 |

## Cancelling Out Multiples

```
#pragma omp parallel for
for (int p = 2; p <= sqrt_n; p++) {
    int thread_id = omp_get_thread_num();
    printf("\nFor thread_id %d, p = %d\n", thread_id, p);
    if (prime[p]) {
        #pragma omp parallel for
        for (int i = p * p; i <= n; i += p) {
        printf("\n For thread_id %d, p = %d, i = %d\n", thread_id, p, i);
        prime[i] = false;
        }
    }
}
```

## Thread Distribution

## Thread Distribution output

```
\begin{tabular}{|c|c|}
\hline C sie & E_openmp.c §output.txt \(\times\) \\
\hline \multicolumn{2}{|l|}{\(\equiv\) output.txt} \\
\hline 1 & Prime numbers up to 49 are: \\
\hline 2 & For thread_id 1, p = 5, i = 25 \\
\hline 3 & \\
\hline 4 & For thread_id 1, p = 5, i = 30 \\
\hline 5 & \\
\hline 6 & For thread_id 1, p = 5, i = 35 \\
\hline 7 & \\
\hline 8 & For thread_id 1, p = 5, i = 40 \\
\hline 9 & \\
\hline 10 & For thread_id 1, p = 5, i = 45 \\
\hline 11 & \\
\hline 12 & Total prime count: 15 \\
\hline 13 & Work took 0.000793 seconds \\
\hline 14 & | \\
\hline
\end{tabular}
```

## Result parallel

Input size: $10^{\wedge} 8$

| Threads | Time in sec |
| :--- | :--- |
| 1 | 1.71 |
| 2 | 1.65 |
| 4 | 1.54 |
| 8 | 2.47 |
| 16 | 2.57 |
| 32 | 2.88 |
| 64 | 4.02 |

## Result parallel

Input size: $10^{\wedge 10}$

| Threads | Time in sec |
| :--- | :--- |
| 1 | 8.88 |
| 2 | 7.66 |
| 4 | 6.10 |
| 8 | 3.66 |
| 16 | 5.04 |
| 32 | 7.24 |
| 64 | 10.49 |

## Speed-Up

Input size: $10^{\wedge} 8$
SpeedUp $=\frac{T_{\text {seq }}}{T_{\text {parallel }}} \quad T_{\text {seq }}=1.71$ seconds.

| Threads | Speedup |
| :--- | :--- |
| 1 | 1 |
| 2 | 1.03 |
| 4 | 1.11 |
| 8 | 0.69 |
| 16 | 0.66 |
| 32 | 0.59 |
| 64 | 0.42 |

## Efficiency

Input size: $10^{\wedge} 8$
Efficiency $=\frac{T_{\text {seq }}}{\operatorname{Cost}} \quad T_{\text {seq }}=1.71$ seconds.

| Threads | Time | Cost | Efficiency |
| :--- | :--- | :--- | :--- |
| 2 | 1.65 | 3.3 | 0.51 |
| 4 | 1.54 | 6.16 | 0.27 |
| 8 | 2.47 | 19.76 | 0.08 |
| 16 | 2.57 | 41.12 | 0.04 |
| 32 | 2.88 | 92.16 | 0.01 |
| 64 | 4.02 | 257.28 | 0.006 |

## Scaled Result(Gustafson's law)

Input size: $10^{\wedge} 6$
Data per thread $=10^{\wedge} 6$

| Threads | Time | Input size |
| :--- | :--- | :--- |
| 1 | 0.73 | $10^{\wedge} 6$ |
| 2 | 0.52 | $2^{\star} 10^{\wedge} 6$ |
| 4 | 0.31 | $4^{\star} 10^{\wedge} 6$ |
| 8 | 0.46 | $8^{\star} 10^{\wedge} 6$ |
| 16 | 0.78 | $16^{\star} 10^{\wedge} 6$ |
| 32 | 0.94 | $32^{\star} 10^{\wedge} 6$ |
| 64 | 1.03 | $64^{\star} 10^{\wedge} 6$ |

## Slurm Script

```
$ sieve_openm.slurm >
openmp_sieve > $ sieve_openm.slurm
        #!/bin/bash
        #!/bin/bash
        #SBATCH --nodes=1
        #SBATCH --ntasks-per-node=1
        #SBATCH --cpus-per-task=64
        #SBAILH --partition=general-compute
        #SBATCH --qos=general-compute
        #SBATCH --cluster=ub-hpc
        #SBATCH --reservation=ubhpc-future
        #SBATCH --exclusive
        #SBATCH --cluster=ub-hpc
        #SBATCH --time=01:00:00
        #SBATCH --output=output_openmp.txt
        #SBATCH --job-name="sieve"
        ## speedup runs
```

Specifying the total number of threads running for the parallel execution

## Script Execution

As requested by the slurm script, we got a single node "cpn-i1406 " which has 64 cores.
commands used:
squeue -u \$USER - to see the list of active nodes snodes cpn-i14-06 - to see the node configuration
