CSE 421/521 - Operating Systems Fall 2011

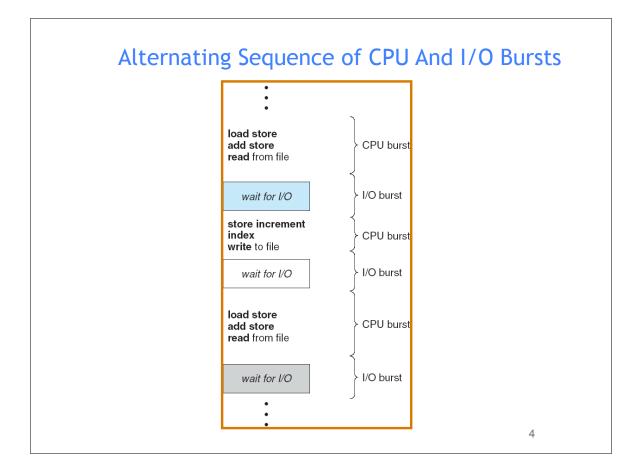

CPU SCHEDULING - I

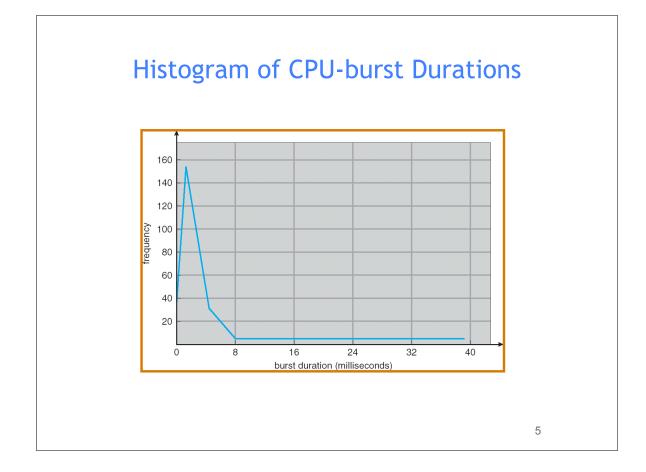

Tevfik Koşar

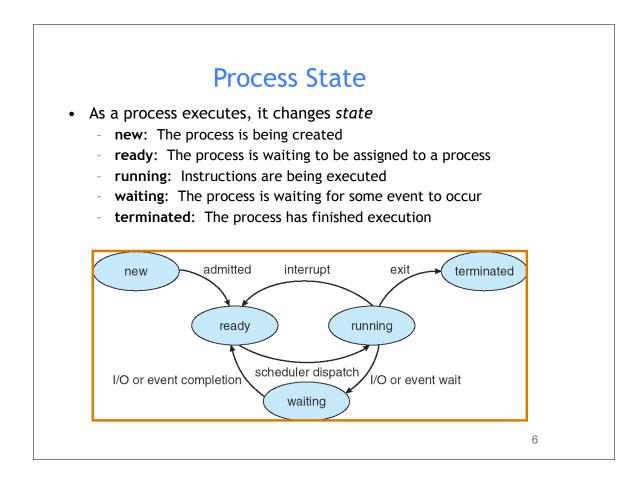

University at Buffalo September 13th, 2011

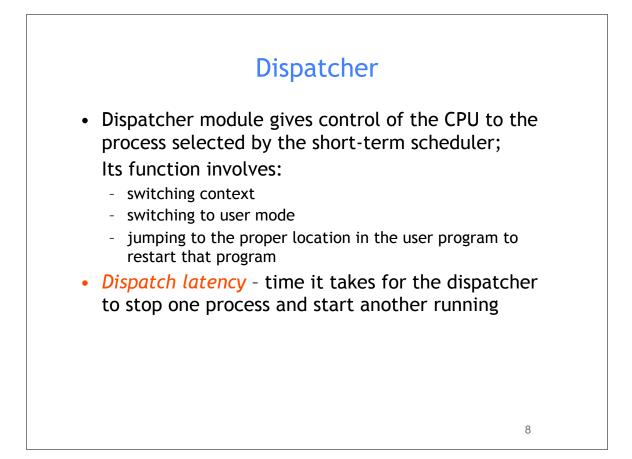

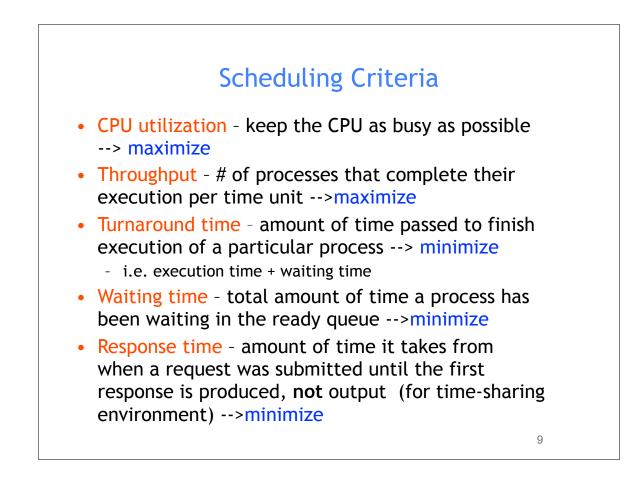

CPU Scheduler

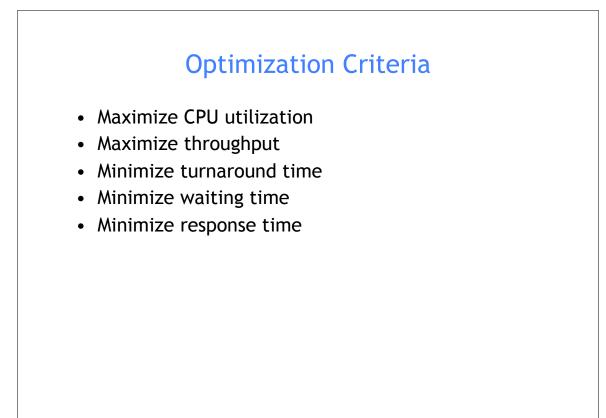

- Selects from among the processes in memory that are ready to execute, and allocates the CPU to one of them
 → short-term scheduler
- CPU scheduling decisions may take place when a process:
 - 1. Switches from running to waiting state
 - 2. Switches from running to ready state
 - 3. Switches from waiting to ready
 - 4. Terminates
 - 5. A new process arrives
- Scheduling under 1 and 4 is *nonpreemptive/cooperative*
 - Once a process gets the CPU, keeps it until termination/switching to waiting state/release of the CPU

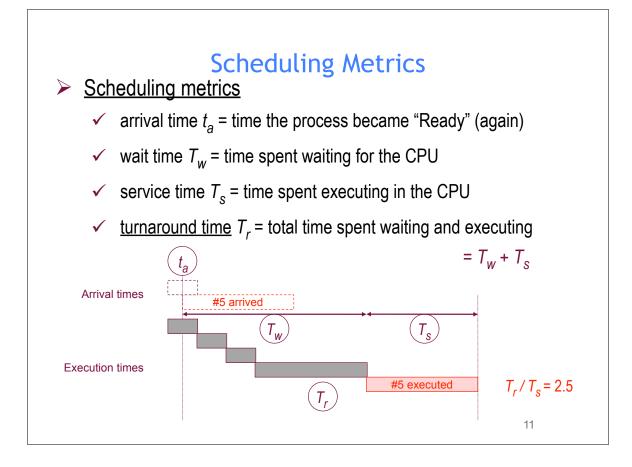

7

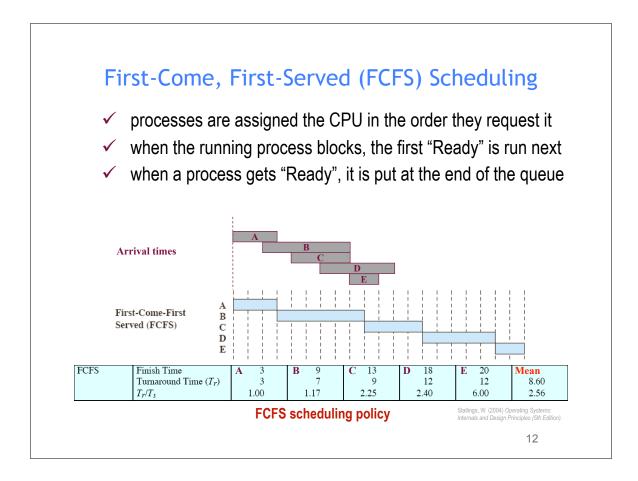

- All other scheduling is *preemptive*
 - Most OS use this
 - Cost associated with access to shared data
 - i.e. time quota expires

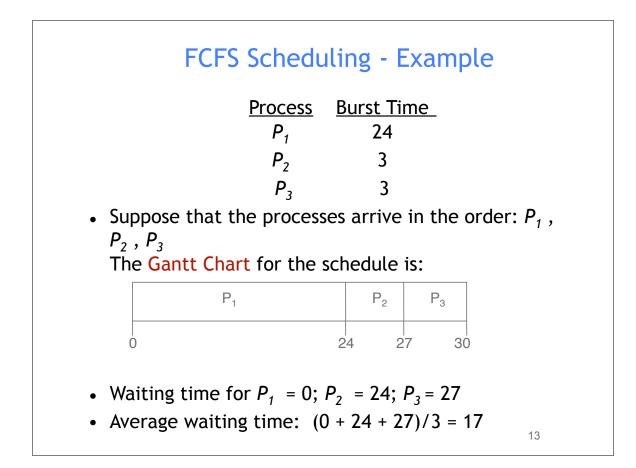

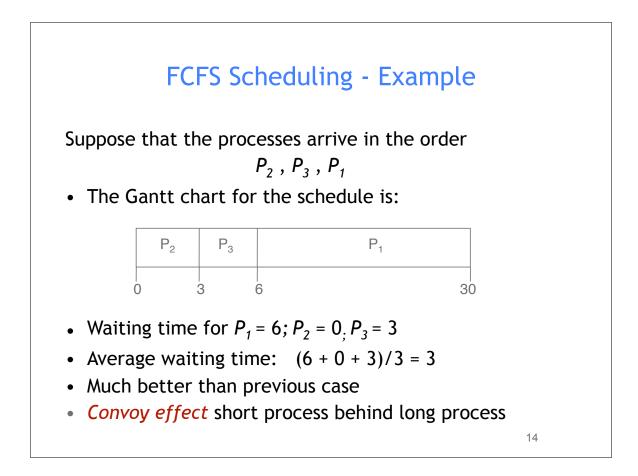

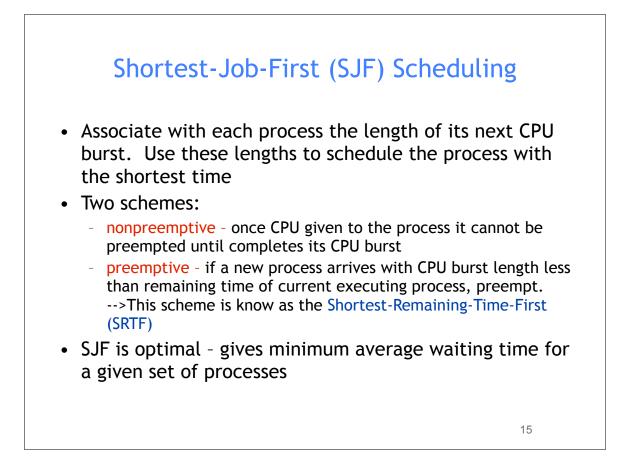

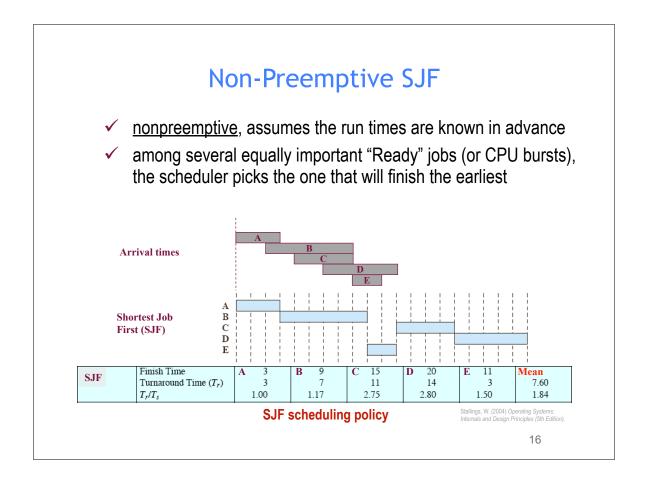

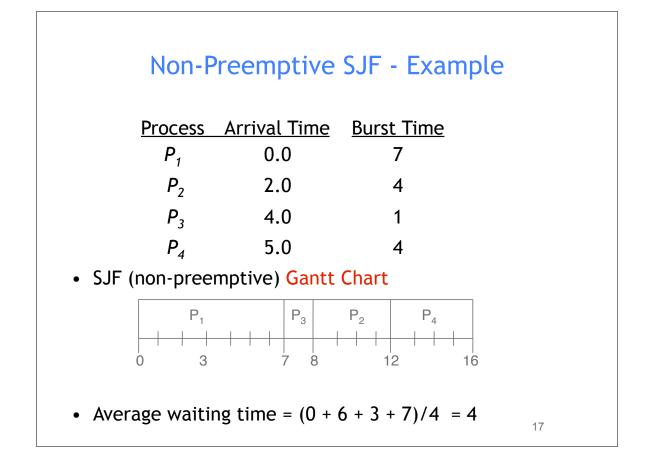

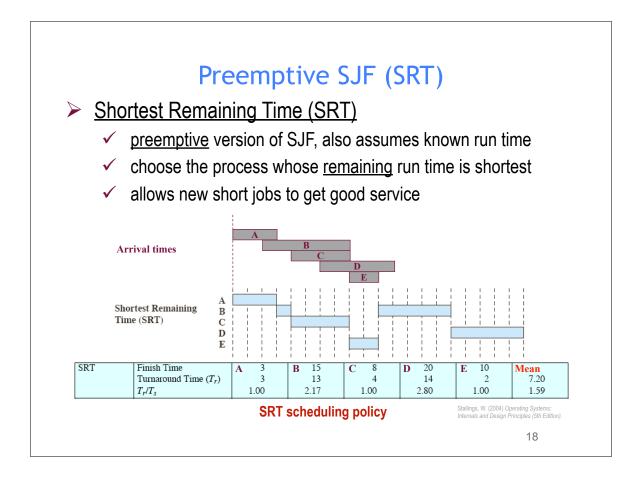

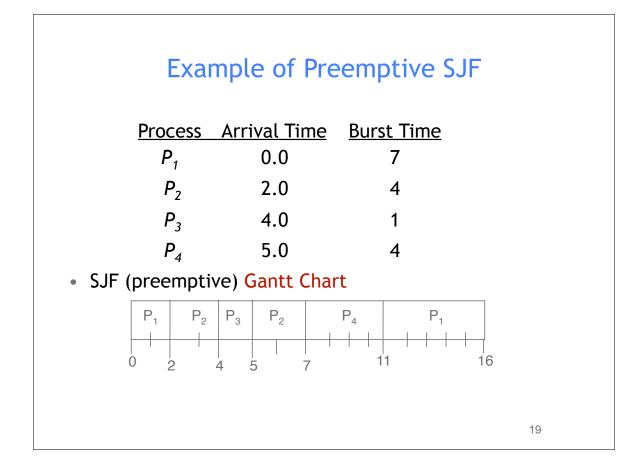

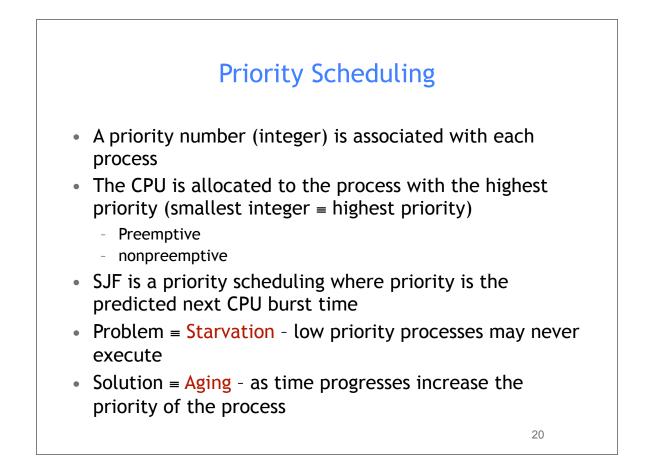

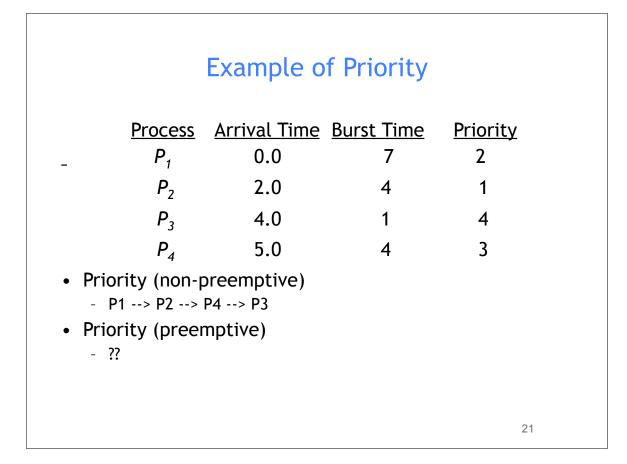

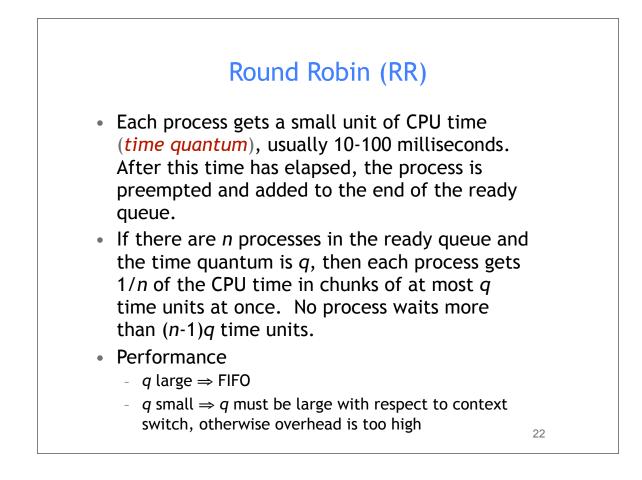

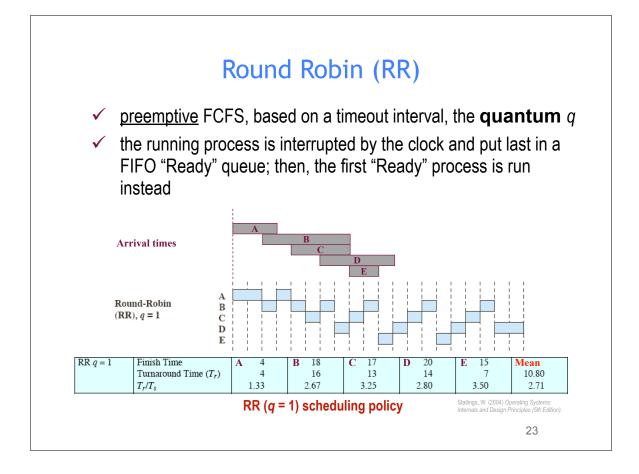

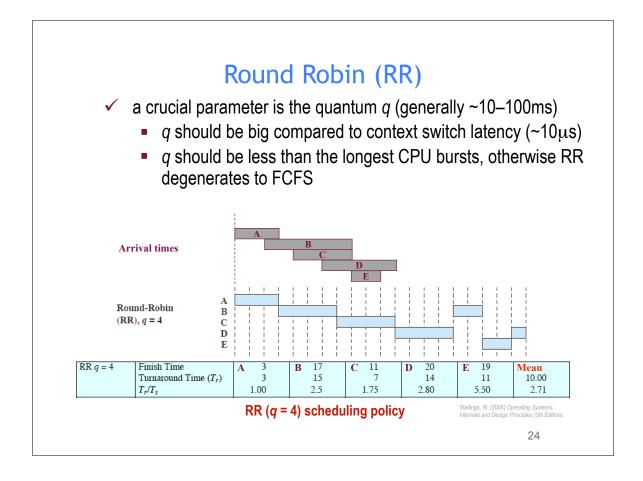

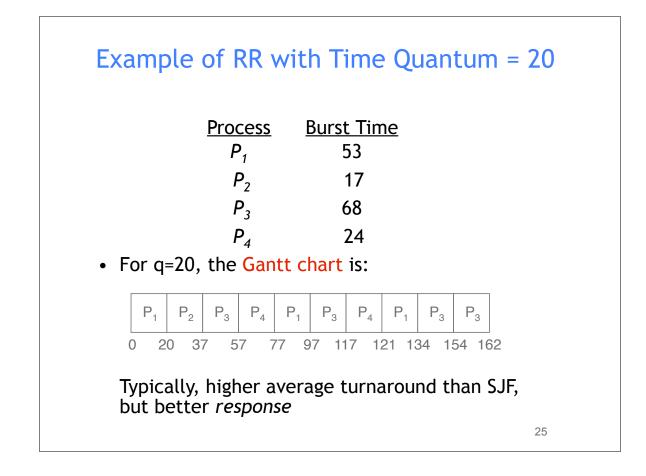

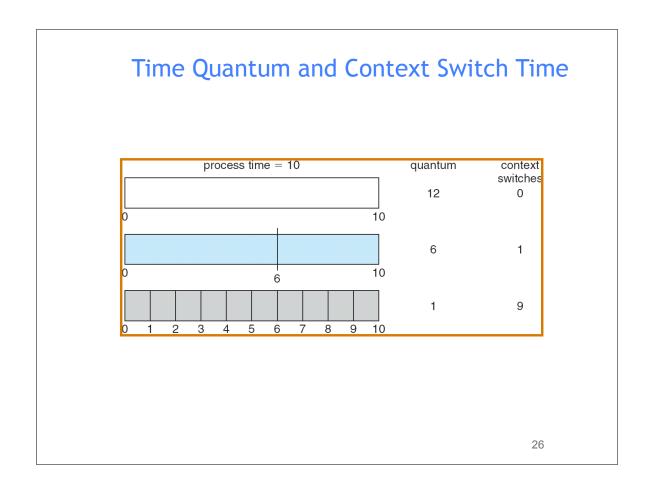

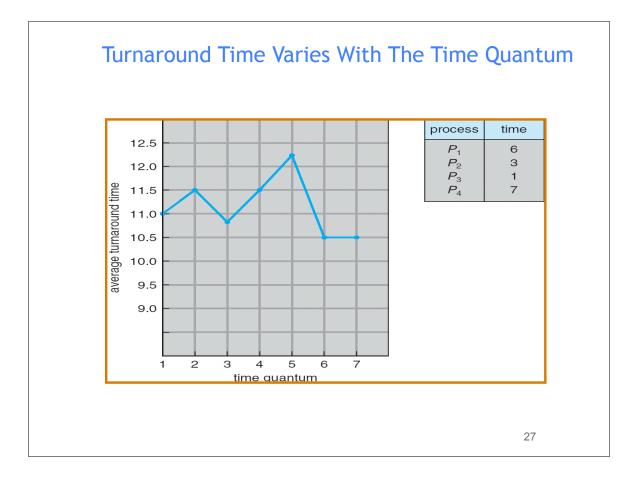

Exercise			
Process ID	Arrival Time	Priority	Burst Time
Α	0	3	20
В	5	1	15
С	10	2	10
D	15	4	5

- Draw gantt charts, find average turnaround and waiting times for above processes, considering:
- 1) First Come First Served Scheduling
- 2) Shortest Job First Scheduling (non-preemptive)
- 3) Shortest Job First Scheduling (preemptive)
- 4) Round-Robin Scheduling
- 5) Priority Scheduling (non-preemptive)
- 6) Priority Scheduling (preemptive)
