1 Introduction

1. Knowledge Representation .................................................. 5
2. Logic .............................................................................. 16
1.1 Knowledge Representation

Artificial Intelligence (AI)
A field of computer science and engineering concerned with the computational understanding of what is commonly called intelligent behavior, and with the creation of artifacts that exhibit such behavior.
Knowledge Representation

A subarea of Artificial Intelligence concerned with understanding, designing, and implementing ways of representing information in computers so that programs (agents) can use this information

- to derive information that is implied by it,
- to converse with people in natural languages,
- to decide what to do next
- to plan future activities,
- to solve problems in areas that normally require human expertise.
Reasoning

Deriving information that is implied by the information already present is a form of reasoning.

Knowledge representation schemes are useless without the ability to reason with them.

So, Knowledge Representation and Reasoning (KRR)
a program has common sense if it automatically deduces for itself a sufficiently wide class of immediate consequences of anything it is told and what it already knows... In order for a program to be capable of learning something it must first be capable of being told it. John McCarthy, “Programs with Common Sense”, 1959.
Knowledge vs. Belief

Knowledge: justified true belief.

John believes that the world is flat: Not true.

Sally believes that the first player in chess can always win, Betty believes that the second player can always win, and Mary believes that, with optimal play on both sides, chess will always end in a tie.

One of them is correct, but none are justified.

So Belief Representation & Reasoning: more accurate
But we’ll continue to say KRR.
In Class Exercise

“An Approach to Serenity”
Easy NL Inferences

Every student studies hard.
Therefore every smart student studies.

Tuesday evening, Jack either went to the movies, played bridge, or studied.
Tuesday evening, Jack played bridge.
Therefore, Jack neither went to the movies nor studied Tuesday evening.
Background Knowledge: Some Sentences and How We Understand Them.

*John likes ice cream.*
   
   John likes to eat ice cream.

*Mary likes Asimov.*

   Mary likes to read books written by Isaac Asimov.
Background Knowledge: Some Sentences and How We Understand Them.

Bill flicked the switch.
The room was flooded with light.
Bill moved the switch to the “on” position, which caused a light to come on, which lit up the room Bill was in.

Betty opened the blinds.
The courtyard was flooded with light.
Betty adjusted the blinds so that she could see through the window they were in front of, after which she could see that the courtyard on the other side of the window was bright.
Memory Integration in Humans

After seeing these sentences (among others),

The sweet jelly was on the kitchen table.
The ants in the kitchen ate the jelly.
The ants ate the sweet jelly that was on the table.
The sweet jelly was on the table.
The jelly was on the table.
The ants ate the jelly.

subjects, with high confidence reported that they had seen the sentence,

The ants ate the sweet jelly that was on the kitchen table.

Page 14
Requirements for a Knowledge-Based Agent

1. “what it already knows” [McCarthy ’59]
   A knowledge base of beliefs.

2. “it must first be capable of being told” [McCarthy ’59]
   A way to put new beliefs into the knowledge base.

3. “automatically deduces for itself a sufficiently wide class of immediate consequences” [McCarthy ’59]
   A reasoning mechanism to derive new beliefs from ones already in the knowledge base.
1.2 Logic

- **Logic** is the study of correct reasoning.
- It is not a particular KRR language.
- There are many systems of logic (logics).
- AI KRR research can be seen as a hunt for the “right” logic.
Commonalities among Logics

• System for reasoning.

• Prevent reasoning from “truths” to “falsities”.
  (But can reason from truths and falsities to truths and falsities.)

• Language for expressing reasoning steps.
Parts of the Study/Specification of a Logic

Syntax: The atomic symbols of the logical language, and the rules for constructing well-formed, nonatomic expressions (symbol structures) of the logic.

Semantics: The meanings of the atomic symbols of the logic, and the rules for determining the meanings of nonatomic expressions of the logic.

Proof Theory: The rules for determining a subset of logical expressions, called theorems of the logic.
2 Propositional Logic

Logics that do not analyze information below the level of the proposition.

2.1 What is a Proposition? ......................................................... 20
2.2 CarPoo World: A Motivational “Micro-World” ...................... 23
2.3 The “Standard” Propositional Logic ...................................... 24
2.4 Important Properties of Logical Systems ............................. 133
2.5 Clause Form Propositional Logic ......................................... 136
2.1 What is a Proposition?

An expression in some language

- that is true or false
- whose negation makes sense
- that can be believed or not
- whose negation can be believed or not
- that can be put in the frame

“I believe that it is not the case that ________.”
Examples

Of propositions

• Betty is the driver of the car.

• Barack Obama is sitting down or standing up.

• If Opus is a penguin, then Opus doesn’t fly.

Of non-propositions

• Barack Obama

• how to ride a bicycle

• If the fire alarm rings, leave the building.
Sentences *vs.* Propositions

A sentence is an expression of a (written) language that begins with a capital letter and ends with a period, question mark, or exclamation point.

Some sentences do not contain a proposition:

“Hi!”, “Why?”, “Pass the salt!”

Some sentences do not express a proposition, but contain one:

“Is Betty driving the car?”

Some sentences contain more than one proposition:

*If Opus is a penguin, then Opus doesn’t fly.*
2.2 CarPool World: A Motivational “Micro-World”

- Tom and Betty carpool to work.
- On any day, either Tom drives Betty or Betty drives Tom.
- In the former case, Tom is the driver and Betty is the passenger.
- In the latter case, Betty is the driver and Tom is the passenger.

  Betty drives Tom. Tom drives Betty.

Propositions: Betty is the driver. Tom is the driver.
Betty is the passenger. Tom is the passenger.
2.3 The “Standard” Propositional Logic

1. Syntax .................................................................................................................. 25
2. Semantics ............................................................................................................... 39
3. Proof Theory ........................................................................................................ 98
2.3.1 Syntax of the “Standard” Propositional Logic

Atomic Propositions

- Any letter of the alphabet, e.g.: $P$
- Any letter of the alphabet with a numerical subscript, e.g.: $Q_3$
- Any alphanumerical string, e.g.: *Tom is the driver*

is an atomic proposition.
Well-Formed Propositions (WFPs)

1. Every atomic proposition is a wfp.

2. If $P$ is a wfp, then so is $(\neg P)$.

3. If $P$ and $Q$ are wfps, then so are

   (a) $(P \land Q)$    (b) $(P \lor Q)$

   (c) $(P \Rightarrow Q)$ (d) $(P \Leftrightarrow Q)$

4. Nothing else is a wfp.

Parentheses may be omitted. Precedence: $\neg; \land, \lor; \Rightarrow; \Leftrightarrow$.
Will allow $(P_1 \land \cdots \land P_n)$ and $(P_1 \lor \cdots \lor P_n)$.
Square brackets may be used instead of parentheses.
Examples of WFPs

\neg(A \land B) \iff (\neg A \lor \neg B)

Tom is the driver \Rightarrow Betty is the passenger

Betty drives Tom \iff \neg Tom is the driver
Alternative Symbols

¬: ¬ !
∧: & ·
∨: |
⇒: → ⊃ ->
⇔: ↔ ≡ <->
A Computer-Readable Syntax for Wfps

Based on CLIF, the Common Logic Interchange Format\textsuperscript{a}

Atomic Propositions: Use one of:

- Embedded underscores: Betty\_drives\_Tom
- Embedded hyphens: Betty-drives-Tom
- CamelCase: BettyDrivesTom
- sulkingCamelCase: bettyDrivesTom
- Escape brackets: \texttt{|Betty drives Tom|}
- Quotation marks: "Betty drives Tom"

# CLIF for Non-Atomic Wfps

<table>
<thead>
<tr>
<th>Print Form</th>
<th>CLIF Form</th>
</tr>
</thead>
<tbody>
<tr>
<td>¬P</td>
<td>(not P)</td>
</tr>
<tr>
<td>P ∧ Q</td>
<td>(and P Q)</td>

<tr>
<td>(P₁ ∨ ⋯ ∨ Pₙ)</td>
<td>(or P₁ ...Pₙ)</td>
</tr>
</tbody>
</table>
Semantics of Atomic Propositions 1
Intensional Semantics

• Dependent on a Domain.

• Independent of any specific interpretation/model/possible world/situation.

• Statement in a previously understood language (e.g. English) that allows truth value to be determined in any specific situation.

• Often omitted, but shouldn’t be.
Intensional CarPool World Semantics

\[Betty \text{ drives } Tom\] = Betty drives Tom to work.
\[Tom \text{ drives Betty}\] = Tom drives Betty to work.
\[Betty \text{ is the driver}\] = Betty is the driver of the car.
\[Tom \text{ is the driver}\] = Tom is the driver of the car.
\[Betty \text{ is the passenger}\] = Betty is the passenger in the car.
\[Tom \text{ is the passenger}\] = Tom is the passenger in the car.
Alternative Intensional CarPool World
Semantics

\[Betty \text{ drives } Tom\] = Tom drives Betty to work.
\[Tom \text{ drives } Betty\] = Betty drives Tom to work.
\[Betty \text{ is the driver}\] = Tom is the passenger in the car.
\[Tom \text{ is the driver}\] = Betty is the passenger in the car.
\[Betty \text{ is the passenger}\] = Tom is the driver of the car.
\[Tom \text{ is the passenger}\] = Betty is the driver of the car.
Alternative CarPool World
Syntax/Intensional Semantics

\[ A \] = Betty drives Tom to work.
\[ B \] = Tom drives Betty to work.
\[ C \] = Betty is the driver of the car.
\[ D \] = Tom is the driver of the car.
\[ E \] = Betty is the passenger in the car.
\[ F \] = Tom is the passenger in the car.
Intensional Semantics Moral

• Don’t omit.
• Don’t presume.
• No “pretend it’s English semantics”.
Intensional Semantics of WFPs

\[ \neg P = \text{It is not the case that } [P]. \]
\[ P \land Q = [P] \text{ and } [Q]. \]
\[ P \lor Q = \text{Either } [P] \text{ or } [Q] \text{ or both.} \]
\[ P \Rightarrow Q = \text{If } [P] \text{ then } [Q]. \]
\[ P \Leftrightarrow Q = [P] \text{ if and only if } [Q]. \]
Example CarPool World Intensional
WFP Semantics

\[ Betty \text{ drives } Tom \leftrightarrow \neg \text{Tom is the driver} \]
= Betty drives Tom to work
  if and only if Tom is not the driver of the car.
Terminology

• $\neg P$ is called the **negation** of $P$.

• $P \land Q$ is called the **conjunction** of $P$ and $Q$.
  $P$ and $Q$ are referred to as **conjuncts**.

• $P \lor Q$ is called the **disjunction** of $P$ and $Q$.
  $P$ and $Q$ are referred to as **disjuncts**.

• $P \Rightarrow Q$ is called a **conditional** or **implication**.
  $P$ is referred to as the **antecedent**;
  $Q$ as the **consequent**.

• $P \Leftrightarrow Q$ is called a **biconditional** or **equivalence**.
2.3.2 Semantics of Atomic Propositions 2

Extensional Semantics

• Relative to an interpretation/model/possible world/situation.
• Either True or False.
## Extensional CarPool World Semantics

<table>
<thead>
<tr>
<th>Proposition</th>
<th>Denotation in Situation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
</tr>
<tr>
<td>Betty drives Tom</td>
<td>True</td>
</tr>
<tr>
<td>Tom drives Betty</td>
<td>True</td>
</tr>
<tr>
<td>Betty is the driver</td>
<td>True</td>
</tr>
<tr>
<td>Tom is the driver</td>
<td>True</td>
</tr>
<tr>
<td>Betty is the passenger</td>
<td>True</td>
</tr>
<tr>
<td>Tom is the passenger</td>
<td>True</td>
</tr>
</tbody>
</table>

Note: $n$ propositions $\Rightarrow 2^n$ possible situations.

6 propositions in CarPool World
$\Rightarrow 2^6 = 64$ different situations.

Page 40
Extensional Semantics of WFPs

$[\neg P]$ is True if $[P]$ is False. Otherwise, it is False.

$[P \land Q]$ is True if $[P]$ is True and $[Q]$ is True. Otherwise, it is False.

$[P \lor Q]$ is False if $[P]$ is False and $[Q]$ is False. Otherwise, it is True.

$[P \Rightarrow Q]$ is False if $[P]$ is True and $[Q]$ is False. Otherwise, it is True.

$[P \iff Q]$ is True if $[P]$ and $[Q]$ are both True, or both False. Otherwise, it is False.

Note that this is the outline of a recursive function that evaluates a wfp, given the truth values of its atomic propositions.
## Extensional Semantics Truth Tables

<table>
<thead>
<tr>
<th>$\neg P$</th>
<th>False</th>
<th>True</th>
</tr>
</thead>
<tbody>
<tr>
<td>$P$</td>
<td>True</td>
<td>False</td>
</tr>
<tr>
<td>$Q$</td>
<td>True</td>
<td>False</td>
</tr>
<tr>
<td>$P \land Q$</td>
<td>True</td>
<td>False</td>
</tr>
<tr>
<td>$P \lor Q$</td>
<td>True</td>
<td>True</td>
</tr>
<tr>
<td>$P \Rightarrow Q$</td>
<td>True</td>
<td>False</td>
</tr>
<tr>
<td>$P \Leftrightarrow Q$</td>
<td>True</td>
<td>False</td>
</tr>
</tbody>
</table>

Notice that each column of these tables represents a different situation.
Material Implication

\[ P \Rightarrow Q \text{ is True when } P \text{ is False.} \]

So,

*If the world is flat, then the moon is made of green cheese* is considered True if *if . . . then* is interpreted as material implication.
\[(P \Rightarrow Q) \iff (\neg P \lor Q)\]

<table>
<thead>
<tr>
<th></th>
<th>(P)</th>
<th>(Q)</th>
<th>(\neg P)</th>
<th>(P \Rightarrow Q)</th>
<th>(\neg P \lor Q)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(P)</td>
<td>True</td>
<td>True</td>
<td>False</td>
<td>True</td>
<td>True</td>
</tr>
<tr>
<td>(Q)</td>
<td>True</td>
<td>False</td>
<td>True</td>
<td>True</td>
<td>True</td>
</tr>
<tr>
<td>(\neg P)</td>
<td>False</td>
<td>False</td>
<td>True</td>
<td>True</td>
<td>True</td>
</tr>
<tr>
<td>(P \Rightarrow Q)</td>
<td>True</td>
<td>False</td>
<td>True</td>
<td>True</td>
<td>True</td>
</tr>
<tr>
<td>(\neg P \lor Q)</td>
<td>True</td>
<td>False</td>
<td>True</td>
<td>True</td>
<td>True</td>
</tr>
</tbody>
</table>

\((P \Rightarrow Q)\) is sometimes taken as a abbreviation of \((\neg P \lor Q)\)

Note: “Uninterpreted Language”, **Formal** Logic, applicable to every logic in the class.
Example CarPool World Truth Table

<table>
<thead>
<tr>
<th>Betty drives Tom</th>
<th>True</th>
<th>True</th>
<th>False</th>
<th>False</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tom is the driver</td>
<td>True</td>
<td>False</td>
<td>True</td>
<td>False</td>
</tr>
<tr>
<td>¬Tom is the driver</td>
<td>False</td>
<td>True</td>
<td>False</td>
<td>True</td>
</tr>
<tr>
<td>Betty drives Tom ⇔ ¬Tom is the driver</td>
<td>False</td>
<td>True</td>
<td>True</td>
<td>False</td>
</tr>
</tbody>
</table>
Computing Denotations

Use the procedure sketched on page 41.

Use Spreadsheet:
See http://www.cse.buffalo.edu/~shapiro/Courses/CSE563/truthTable.xls/

Use Boole program from Barwise & Etchemendy package
Computing the Denotation of a Wfp in a Model

Construct a truth table containing all atomic wfps and the wfp whose denotation is to be computed, and restrict the truth table to the desired model.
E.g., play with http://www.cse.buffalo.edu/~shapiro/Courses/CSE563/cpw.xls/

Use the program /projects/shapiro/CSE563/denotation
Example Runs of denotation Program

cl-user(1): (denotation '(if p (if q p))
    '(((p . True) (q . False)))
True

cl-user(2): (denotation
    '(if BettyDrivesTom
        (not TomIsThePassenger))
    '(((BettyDrivesTom . True)
        (TomIsThePassenger . True)))
False
A model **satisfies** a wfp if the wfp is True in that model.

If a wfp $P$ is False in a model, $\mathcal{M}$, then $\mathcal{M}$ satisfies $\neg P$.

A model satisfies a set of wfps if they are all True in the model.

A model, $\mathcal{M}$, satisfies the wfps $P_1, \ldots, P_n$ if and only if $\mathcal{M}$, satisfies $P_1 \land \ldots \land P_n$.

Task: Given a set of wfps, $A$, find **satisfying models**.
I.e., models that assign all wfps in $A$ the value True.
Model Finding with a Spreadsheet

Play with http:
//www.cse.buffalo.edu/~shapiro/Courses/CSE563/cpw.xls/
An Informal Model Finding Algorithm (Exponential)

• Given: Wfps labeled True, False, or unlabeled.

• If any wfp is labeled both True and False, terminate with failure.

• If all atomic wfps are labeled, return labeling as a model.

• If $\neg P$ is
  – labeled True, try labeling $P$ False.
  – labeled False, try labeling $P$ True.

• If $P \land Q$ is
  – labeled True, try labeling $P$ and $Q$ True.
  – labeled False, try labeling $P$ False, and try labeling $Q$ False.
Model Finding Algorithm, cont’d

- If $P \lor Q$ is
  - labeled False, try labeling $P$ and $Q$ False.
  - labeled True, try labeling $P$ True, and try labeling $Q$ True.

- If $P \Rightarrow Q$ is
  - labeled False, try labeling $P$ True and $Q$ False.
  - labeled True, try labeling $P$ False, and try labeling $Q$ True.

- If $P \Leftrightarrow Q$ is
  - labeled True, try labeling $P$ and $Q$ both True, and try labeling $P$ and $Q$ both False.
  - labeled False, try labeling $P$ True and $Q$ False, and try labeling $P$ False and $Q$ True.
Tableau Procedure for Model Finding\textsuperscript{a}

\[ T : BP \Rightarrow \neg BD \]

\[ T : TD \Rightarrow BP \]

\[ F : \neg BD \]

---

\textsuperscript{a}Based on the semantic tableaux of Evert W. Beth, \textit{The Foundations of Mathematics}, (Amsterdam: North Holland), 1959.
Tableau Procedure Example: Step 1

\[ T : BP \Rightarrow \neg BD \]

\[ T : TD \Rightarrow BP \]

\[ F : \neg BD \leftarrow \]

\[ T : BD \]
Tableau Procedure Example: Step 2

\[ T : BP \implies \neg BD \leftarrow \]
\[ T : TD \implies BP \]
\[ F : \neg BD \]
\[ T : BD \]
\[ F : BP \]
\[ T : \neg BD \]
\[ \times \]

Page 55
Tableau Procedure Example: Step 3

\[ T : BP \Rightarrow \neg BD \]

\[ T : TD \Rightarrow BP \leftarrow \]

\[ F : \neg BD \]

\[ T : BD \]

\[ F : BP \quad T : \neg BD \]

\[ F : TD \quad T : BP \]

!TomIsDriver.
Semantic Properties of WFPs

• A wfp is **satisfiable** if it is True in at least one situation.

• A wfp is **contingent** if it is True in at least one situation and False in at least one situation.

• A wfp is **valid** ($\models P$) if it is True in every situation. A valid wfp is also called a **tautology**.

• A wfp is **unsatisfiable** or **contradictory** if it is False in every situation.
## Examples

<table>
<thead>
<tr>
<th>$P$</th>
<th>$Q$</th>
<th>$\neg P$</th>
<th>$Q \Rightarrow P$</th>
<th>$P \Rightarrow (Q \Rightarrow P)$</th>
<th>$P \land \neg P$</th>
</tr>
</thead>
<tbody>
<tr>
<td>True</td>
<td>True</td>
<td>False</td>
<td>True</td>
<td>True</td>
<td>False</td>
</tr>
<tr>
<td>True</td>
<td>False</td>
<td>False</td>
<td>True</td>
<td>False</td>
<td>False</td>
</tr>
<tr>
<td>False</td>
<td>False</td>
<td>True</td>
<td>True</td>
<td>True</td>
<td>False</td>
</tr>
<tr>
<td>False</td>
<td>True</td>
<td>True</td>
<td>False</td>
<td>True</td>
<td>False</td>
</tr>
<tr>
<td>False</td>
<td>False</td>
<td>True</td>
<td>True</td>
<td>True</td>
<td>False</td>
</tr>
</tbody>
</table>

$\neg P$, $Q \Rightarrow P$, and $P \Rightarrow (Q \Rightarrow P)$ are satisfiable,

$\neg P$ and $Q \Rightarrow P$ are contingent,

$P \Rightarrow (Q \Rightarrow P)$ is valid,

$P \land \neg P$ is contradictory.
Logical Entailment

\[ \{A_1, \ldots, A_n\} \text{ logically entails } B \text{ in logic } \mathcal{L} \]

\[ A_1, \ldots, A_n \models_{\mathcal{L}} B \]

if \( B \) is True in every situation in which every \( A_i \) is True.

If \( \mathcal{L} \) is assumed,

\[ A_1, \ldots, A_n \models B \]

If \( n = 0 \), we have validity

\[ \models B, \]

i.e., \( B \) is True in every situation.
### Examples

| \( P \) | True | True | False | False |
| \( Q \) | True | False | True | False |
| \( \neg P \) | False | False | True | True |
| \( Q \Rightarrow P \) | True | True | False | True |
| \( P \Rightarrow (Q \Rightarrow P) \) | True | True | True | True |
| \( P \land \neg P \) | False | False | False | False |

\[
\models P \Rightarrow (Q \Rightarrow P)
\]

\[
P \models Q \Rightarrow P
\]

\[
Q, Q \Rightarrow P \models P
\]
A Metatheorem

\[ A_1, \ldots, A_n \models B \]

iff

\[ A_1 \land \cdots \land A_n \models B \]
Semantic Deduction Theorem  
(Metatheorem)

\[ A_1, \ldots, A_n \models P \text{ if and only if } \models A_1 \land \cdots \land A_n \Rightarrow P. \]

So deciding validity and logical entailment are equivalent.
Domain Knowledge (Rules)

Used to reduce the set of situations to those that “make sense”.

Page 67
Domain Rules for CarPool World

Betty is the driver ⇔ ¬Betty is the passenger

Tom is the driver ⇔ ¬Tom is the passenger

Betty drives Tom ⇒ Betty is the driver ∧ Tom is the passenger

Tom drives Betty ⇒ Tom is the driver ∧ Betty is the passenger

Tom drives Betty ∨ Betty drives Tom
# Sensible CarPool World Situations

The only 2 of the 64 in which all domain rules are True:

<table>
<thead>
<tr>
<th>Proposition</th>
<th>Denotation in Situation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Betty drives Tom</td>
<td>True</td>
</tr>
<tr>
<td>Tom drives Betty</td>
<td>False</td>
</tr>
<tr>
<td>Betty is the driver</td>
<td>True</td>
</tr>
<tr>
<td>Tom is the driver</td>
<td>False</td>
</tr>
<tr>
<td>Betty is the passenger</td>
<td>False</td>
</tr>
<tr>
<td>Tom is the passenger</td>
<td>True</td>
</tr>
<tr>
<td>Betty drives Tom $\iff \neg$ Tom is the driver</td>
<td>True</td>
</tr>
</tbody>
</table>

Page 69
General Effect of Domain Rules

The number of models that satisfy a set of wfps is reduced (or stays the same) as the size of the set increases.

For a set of wfps, $\Gamma$, and a wfp $P$, if the number of models that satisfy $\Gamma \cup \{P\}$ is strictly less than the number of models that satisfy $\Gamma$, then $P$ is independent of $\Gamma$.

The KRR Enterprise
(Propositional Logic Version)

Given a domain you are interested in reasoning about:

1. List the set of propositions (expressed in English) that captures the basic information of interest in the domain.

2. Formalize the domain by creating one atomic wfp for each proposition listed in step (1). List the atomic wfps, and, for each, show the English proposition as its intensional semantics.
3. Using the atomic wfps, determine a set of domain rules so that all, but only, the situations of the domain that make sense satisfy them. Strive for a set of domain rules that is small and independent.

4. Optionally, formulate an additional set of situation-specific wfps that further restrict the domain to the set of situations you are interested in. We will call this restricted domain the “subdomain”.

5. Letting $\Gamma$ be the set of domain rules plus situation-specific wfps, and $A$ be any proposition you are interested in, $A$ is True in the subdomain if $\Gamma \models A$, is false in the subdomain if $\Gamma \models \neg A$, and otherwise is True in some more specific situations of the subdomain, and False in others.
Computational Methods for Determining Entailment and Validity

Version 1

(defun entails (KB Q)
  "Returns t if the knowledge base KB entails the query Q; else returns nil."
  (loop for model in (models KB)
    unless (denotation Q model)
    do (return-from entails nil))
  t)

Two problems:
1. **models** does not really return all the satisfying models;
2. **entails** does extra work.
Tableau Methods
Model-Finding Refutation

To Show $A_1, \ldots, A_n \models P$:

- Try to find a model that satisfies $A_1, \ldots, A_n$ but falsifies $P$.
- If you succeed, $A_1, \ldots, A_n \not\models P$.
- If you fail, $A_1, \ldots, A_n \models P$.

All refutation model-finding methods are commonly called “tableau methods”.

Semantic Tableaux and Wang’s Algorithm are two tableau methods that are decision procedures for logical entailment in Propositional Logic.
The semantic tableau refutation procedure is the same as the tableau model-finding procedure we saw earlier, except it uses model finding refutation to show $A_1, \ldots, A_n \models P$.

The goal is that all branches be closed.

Can stop as soon as one satisfying model has been found.
Wang’s Algorithm
A Model-Finding Refutation Procedure

wang(\text{Twfps, Fwfps}) \{ 
/*
* \text{Twfps} and \text{Fwfps} are sets of wfps.
* Returns True if there is no model
* that satisfies \text{Twfps} and falsifies \text{Fwfps};
* Otherwise, returns False.
* /

Note: is a version of models, but returns the opposite value.

---

Wang Algorithm

if $Twfps$ and $Fwfps$ intersect, return True;
if every $A \in Twfps \cup Fwfps$ is atomic, return False;

if $(P = (not \ A)) \in Twfps$,
    return wang($Twfps \setminus \{P\}, Fwfps \cup \{A\}$);
if $(P = (not \ A)) \in Fwfps$,
    return wang($Twfps \cup \{A\}, Fwfps \setminus \{P\}$);
Wang Algorithm

if \((P = (\text{and} \ A \ B)) \in Twfps\),
    return wang\(((Twfps \setminus \{P\}) \cup \{A, B\}, Fwfps)\);
if \((P = (\text{and} \ A \ B)) \in Fwfps\),
    return wang\((Twfps, (Fwfps \setminus \{P\}) \cup \{A\})\)
    and wang\((Twfps, (Fwfps \setminus \{P\}) \cup \{B\})\);

if \((P = (\text{or} \ A \ B)) \in Twfps\),
    return wang\(((Twfps \setminus \{P\}) \cup \{A\}, Fwfps)\);
    and wang\(((Twfps \setminus \{P\}) \cup \{B\}, Fwfps)\);
if \((P = (\text{or} \ A \ B)) \in Fwfps\),
    return wang\((Twfps, (Fwfps \setminus \{P\}) \cup \{A, B\})\)
Wang Algorithm

if \((P = (if \ A \ B)) \in Twfps\),
return \(wang(Twfps \setminus \{P\}, \ Fwfps \cup \{A\})\)
and \(wang((Twfps \setminus \{P\}) \cup \{B\}, \ Fwfps)\);

if \((P = (if \ A \ B)) \in Fwfps\),
return \(wang(Twfps \cup \{A\}, \ (Fwfps \setminus \{P\}) \cup \{B\})\);

if \((P = (iff \ A \ B)) \in Twfps\),
return \(wang((Twfps \setminus \{P\}) \cup \{A, B\}, \ Fwfps)\)
and \(wang(Twfps \setminus \{P\}, \ Fwfps \cup \{A, B\})\);

if \((P = (iff \ A \ B)) \in Fwfps\),
return \(wang(Twfps \cup \{A\}, \ (Fwfps \setminus \{P\}) \cup \{B\})\)
and \(wang(Twfps \cup \{B\}, \ (Fwfps \setminus \{P\}) \cup \{A\})\);
Implemented Wang Function

(wang '((A_1, \ldots, A_n) \; (P)))

Returns \texttt{t} if \(A_1, \ldots, A_n \models P\);
\texttt{nil} otherwise.
(wang $KB$ $(Query)$)
Returns $t$ if the $Query$ follows from the $KB$
nil otherwise.

Front end:

(entails $KB$ $Query$)
Returns $t$ if the $Query$ follows from the $KB$
nil otherwise.

2[2]: returned t

2[2]: (wang ((not BD) BP TD) ((not BD)))

2[2]: returned t

1[2]: returned t

0[2]: returned t

\[ t \]
Properties of Wang’s Algorithm

1. Wang’s Algorithm is **sound**:  
   If \( (\text{wang } A \ ' (B)) = t \) then \( A \models B \)

2. Wang’s Algorithm is **complete**:  
   If \( A \models B \) then \( (\text{wang } A \ ' (B)) = t \)

3. Wang’s Algorithm is a **decision procedure**:  
   For any valid inputs \( A, B, \)  
   \( (\text{wang } A \ ' (B)) \) terminates  
   and returns \( t \) iff \( A \models B \)
Example: Tom’s Evening Domain

If there is a good movie on TV and Tom doesn’t have an early appointment the next morning, then he stays home and watches a late movie. If Tom needs to work and doesn’t have an early appointment the next morning, then he works late. If Tom works and needs his reference materials, then he works at his office. If Tom works late at his office, then he returns to his office. If Tom watches a late movie or works late, then he stays up late.

Assume: Tom needs to work, doesn’t have an early appointment, and needs his reference materials.

Prove: Tom returns to his office and stays up late.

Page 97

2.3.3 Proof Theory of the Standard Propositional Logic

- Specifies when a given wfp can be derived correctly from a set of (other) wfps.
  \[ A_1, \ldots, A_n \vdash P \]

- Determines what wfps are theorems of the logic.
  \[ \vdash P \]

- Depends on the notion of proof.
Hilbert-Style Syntactic Inference

- Set of Axioms.
- Small set of Rules of Inference.
A **proof** of a theorem $P$ is

- An ordered list of wfps ending with $P$
- Each wfp on the list is
  * Either an axiom
  * or follows from previous wfps in the list by one of the rules of inference.
Hilbert-Style Derivation

• A derivation of \( P \) from \( A_1, \ldots, A_n \) is
  – A list of wfps ending with \( P \)
  – Each wfp on the list is
    * Either an axiom
    * or some \( A_i \)
    * or follows from previous wfps in the list by one of the rules of inference.
Example Hilbert-Style Axioms

All instances of:

(A1). \((A \Rightarrow (B \Rightarrow A))\)

(A2). \(((A \Rightarrow (B \Rightarrow C)) \Rightarrow ((A \Rightarrow B) \Rightarrow (A \Rightarrow C)))\)

(A3). \(((\neg B \Rightarrow \neg A) \Rightarrow ((\neg B \Rightarrow A) \Rightarrow B))\)

Hilbert-Style Rule of Inference

Modus Ponens

\[ A, A \Rightarrow B \]

\[ B \]
Example Hilbert-Style Proof
that $\vdash A \Rightarrow A$

(1) $(A \Rightarrow ((A \Rightarrow A) \Rightarrow A))$
\hspace{1cm} $\Rightarrow ((A \Rightarrow (A \Rightarrow A)) \Rightarrow (A \Rightarrow A))$ Instance of A2
(2) $A \Rightarrow ((A \Rightarrow A) \Rightarrow A)$ Instance of A1
(3) $(A \Rightarrow (A \Rightarrow A)) \Rightarrow (A \Rightarrow A)$ From 1, 2 by MP
(4) $A \Rightarrow (A \Rightarrow A)$ Instance of A1
(5) $A \Rightarrow A$ From 3, 4 by MP
Example Hilbert-Style Derivation

that

Tom is the driver

Tom is the driver ⇒ Betty is the passenger,

Betty is the passenger ⇒ ¬Betty is the driver,

⊢ ¬Betty is the driver

(1) Tom is the driver Assumption
(2) Tom is the driver ⇒ Betty is the passenger Assumption
(3) Betty is the passenger From 1, 2 by MP
(4) Betty is the passenger ⇒ ¬Betty is the driver Assumption
(5) ¬Betty is the driver From 3, 4 by MP

Natural Deduction
(Style of Syntactic Inference)

• No Axioms.

• Large set of Rules of Inference.
  – A few structural rules of inference.
  – An introduction rule and an elimination rule for each connective.

• A method of subproofs.a

Page 107

Fitch-Style Proof\(^a\)

- A **proof** of a theorem \(P\) is
  - An ordered list of wfps and subproofs ending with \(P\)
  - Each wfp or subproof on the list must be justified by a rule of inference.

- \(\vdash P\) is read “\(P\) is a theorem.”

---

Fitch-Style Derivation

- A **derivation** of a wfp $P$ from an assumption $A$ is a hypothetical subproof whose hypothesis is $A$ and which contains
  - An ordered list of wfps and inner subproofs ending with $P$
  - Each wfp or inner subproof on the list must be justified by a rule of inference.

- $A \vdash P$ is read “$P$ can be derived from $A.$”

- A Meta-theorem: $A_1 \land \ldots \land A_n \vdash P$ iff $A_1, \ldots, A_n \vdash P$

BettyIsThePassenger!
More Connections

• Deduction Theorem: $A \vdash P$ if and only if $\vdash A \Rightarrow P$.

• So proving theorems and deriving conclusions from assumptions are equivalent.

• But no atomic proposition is a theorem.

• So theorem proving makes more use of Introduction Rules than most AI reasoning systems.
2.4 Important Properties of Logical Systems

Soundness: \( \vdash P \) implies \( \models P \)

Consistency: not both \( \vdash P \) and \( \vdash \neg P \)

Completeness: \( \models P \) implies \( \vdash P \)
More Connections

• If at most 1 of $\models P$ and $\models \neg P$ then soundness implies consistency.

• Soundness is the essence of “correct reasoning.”

• Completeness less important for running systems since a proof may take too long to wait for.

• The Propositional Logics we have been looking at are complete.

• Gödel’s Incompleteness Theorem: A logic strong enough to formalize arithmetic is either inconsistent or incomplete.
More Connections

\[ A_1, \ldots, A_n \vdash P \iff \vdash A_1 \land \ldots \land A_n \Rightarrow P \]

soundness $\Downarrow\Uparrow$ completeness

\[ A_1, \ldots, A_n \models P \iff \models A_1 \land \ldots \land A_n \Rightarrow P \]

2.5.4 Resolution Refutation ........................................ 147
2.5.5 Translating Standard Wfps into Clause Form .......... 159
2.5.1 Clause Form Syntax

Syntax of Atoms and Literals

Atomic Propositions:
- Any letter of the alphabet
- Any letter with a numerical subscript
- Any alphanumeric string.

Literals:
If \( P \) is an atomic proposition, \( P \) and \( \neg P \) are literals.
\( P \) is called a positive literal
\( \neg P \) is called a negative literal.
Clause Form Syntax
Syntax of Clauses and Sets of Clauses

**Clauses:** If $L_1, \ldots, L_n$ are literals
then the set $\{L_1, \ldots, L_n\}$ is a clause.

**Sets of Clauses:** If $C_1, \ldots, C_n$ are clauses
then the set $\{C_1, \ldots, C_n\}$ is a set of clauses.
2.5.2 Clause Form Semantics

Atomic Propositions

**Intensional:** \([P]\) is some proposition in the domain.

**Extensional:** \([P]\) is either True or False.
Clause Form Semantics: Literals

**Positive Literals:** The meaning of $P$ as a literal is the same as it is as an atomic proposition.

**Negative Literals:**

**Intensional:**

$\neg P$ means that it is not the case that $P$.

**Extensional:** $\neg P$ is True if $P$ is False; Otherwise, it is False.
Clause Form Semantics: Clauses

Intensional:
\[ \{L_1, \ldots, L_n\} = [L_1] \text{ and/or } \ldots \text{ and/or } [L_n]. \]

Extensional:
\[ \llbracket \{L_1, \ldots, L_n\} \rrbracket \] is True
if at least one of \[ [L_1], \ldots, [L_n] \] is True;
Otherwise, it is False.
Clause Form Semantics: Sets of Clauses

Intensional:
\[ \{C_1, \ldots, C_n\} = [C_1] \text{ and } \ldots \text{ and } [C_n]. \]

Extensional:
\[ \{C_1, \ldots, C_n\} \text{ is True if } [C_1] \text{ and } \ldots \text{ and } [C_n] \text{ are all True}; \]
Otherwise, it is False.
2.5.3 Clause Form Proof Theory: Resolution

Notion of Proof: None!

Notion of Derivation: A set of clauses constitutes a derivation.

Assumptions: The derivation is initialized with a set of assumption clauses $A_1, \ldots, A_n$.

Rule of Inference: A clause may be added to a set of clauses if justified by resolution.

Derived Clause: If clause $Q$ has been added to a set of clauses initialized with the set of assumption clauses $A_1, \ldots, A_n$ by one or more applications of resolution, then $A_1, \ldots, A_n \vdash Q$. 
Resolution

\[ \{P, L_1, \ldots, L_n\}, \{-P, L_{n+1}, \ldots, L_m\} \]

\[ \{L_1, \ldots, L_n, L_{n+1}, \ldots, L_m\} \]

Resolution is sound, but not complete!
Example Derivation

1. \{¬\text{TomIsTheDriver}, \neg\text{TomIsThePassenger}\} \quad \text{Assumption}
2. \{\text{TomIsThePassenger, BettyIsThePassenger}\} \quad \text{Assumption}
3. \{\text{TomIsTheDriver}\} \quad \text{Assumption}

4. \{¬\text{TomIsThePassenger}\} \quad R,1,3
5. \{\text{BettyIsThePassenger}\} \quad R,2,4
Example of Incompleteness

\{P\} \models \{P, Q\}

but

\{P\} \not\models \{P, Q\}

because resolution does not apply to \{\{P\}\}.
2.5.4 Resolution Refutation

• Notice that \(\{ P \}, \{ \neg P \} \) is contradictory.

• Notice that resolution applies to \(\{ P \}\) and \(\{ \neg P \}\) producing \(\{ \}\), the empty clause.

• If a set of clauses is contradictory, repeated application of resolution is guaranteed to produce \(\{ \}\).
Implications

• Set of clauses \( \{A_1, \ldots, A_n, Q\} \) is contradictory
• means \((A_1 \land \ldots \land A_n \land Q)\) is False in all models
• means whenever \((A_1 \land \ldots \land A_n)\) is True, \(Q\) is False
• means whenever \((A_1 \land \ldots \land A_n)\) is True \(\neg Q\) is True
• means \(A_1, \ldots, A_n \models \neg Q\).
Negation and Clauses

\[ \neg \{L_1, \ldots, L_n\} = \{\neg L_1, \ldots, \neg L_n\}. \]

\[ \neg L = \begin{cases} 
\neg A & \text{if } L = A \\
A & \text{if } L = \neg A 
\end{cases} \]
Resolution Refutation

To decide if $A_1, \ldots, A_n \models Q$:

1. Let $S = \{A_1, \ldots, A_n\} \cup \neg Q$ \hspace{1cm} (Note: $\neg Q$ is a set of clauses.)

2. Repeatedly apply resolution to clauses in $S$.
   \hspace{1cm} (Determine if $\{A_1, \ldots, A_n\} \cup \neg Q \vdash \{}$)

3. If generate $\{\}$, $A_1, \ldots, A_n \models Q$.
   \hspace{1cm} (If $\{A_1, \ldots, A_n\} \cup \neg Q \vdash \}$ then $A_1, \ldots, A_n \models Q$)

4. If reach point where no new clause can be generated, but $\{\}$ has not appeared, $A_1, \ldots, A_n \not\models Q$.
   \hspace{1cm} (If $\{A_1, \ldots, A_n\} \cup \neg Q \nvdash \{}$ then $A_1, \ldots, A_n \not\models Q$)
Example 1

To decide if \( \{P\} \models \{P, Q\} \)

\[ S = \left\{ \{P\}, \{\neg P\}, \{\neg Q\} \right\} \]

1. \( \{P\} \) \hspace{1cm} \text{Assumption}
2. \( \{\neg P\} \) \hspace{1cm} \text{From query clause}
3. \( \{\} \) \hspace{1cm} \text{R, 1, 2}
Example 2

To decide if

\{\neg \text{TomIsTheDriver}, \neg \text{TomIsThePassenger}\},
\{\text{TomIsThePassenger}, \text{BettyIsThePassenger}\},
\{\text{TomIsTheDriver}\} \models \{\text{BettyIsThePassenger}\}

1. \{\neg \text{TomIsTheDriver}, \neg \text{TomIsThePassenger}\} Assumption
2. \{\text{TomIsThePassenger}, \text{BettyIsThePassenger}\} Assumption
3. \{\text{TomIsTheDriver}\} Assumption
4. \{\neg \text{BettyIsThePassenger}\} From query clause
5. \{\text{TomIsThePassenger}\} R, 2, 4
6. \{\neg \text{TomIsTheDriver}\} R, 1, 5
7. \{} R, 3, 6
Resolution Efficiency Rules

**Tautology Elimination:** If clause $C$ contains literals $L$ and $\neg L$, delete $C$ from the set of clauses. (Check throughout.)

**Pure-Literal Elimination:** If clause $C$ contains a literal $A$ ($\neg A$) and no clause contains a literal $\neg A$ ($A$), delete $C$ from the set of clauses. (Check throughout.)

**Subsumption Elimination:** If the set of clauses contains clauses $C_1$ and $C_2$ such that $C_1 \subseteq C_2$, delete $C_2$ from the set of clauses. (Check throughout.)

These rules delete unhelpful clauses.
Resolution Strategies

**Unit Preference:** Resolve shorter clauses before longer clauses.

**Set of Support:** One clause in each pair being resolved must descend from the query.

Many others

These are heuristics for finding {} faster.

  (rewrite ~conclusion 1))
)
:proof-found
Properties of Resolution Refutation

Resolution Refutation is sound, complete, and a decision procedure for Clause Form Propositional Logic.

It remains so when Tautology Elimination, Pure-Literal Elimination, Subsumption Elimination and the Unit-Preference Strategy are included.

It remains so when Set of Support is used as long as the assumptions are not contradictory.
Every set of clauses,

\[ \{\{L_{1,1}, \ldots, L_{1,n_1}\}, \ldots, \{L_{m,1}, \ldots, L_{m,n_m}\}\} \]

has the same semantics as the standard wfp

\[ ((L_{1,1} \lor \cdots \lor L_{1,n_1}) \land \cdots \land (L_{m,1} \lor \cdots \lor L_{m,n_m})) \]

That is, there is a translation from any set of clauses into a well-formed proposition of standard propositional logic.

Question: Is there a translation from any well-formed proposition of standard propositional logic into a set of clauses?

Answer: Yes!
Translating Standard Wfps into Clause Form

Conjunctive Normal Form (CNF)

A standard wfp is in CNF if it is a conjunction of disjunctions of literals.

\[ ((L_{1,1} \lor \cdots \lor L_{1,n_1}) \land \cdots \land (L_{m,1} \lor \cdots \lor L_{m,n_m})) \]

Translation technique:

1. Turn any arbitrary wfp into CNF.

2. Translate the CNF wfp into a set of clauses.
Translating Standard Wfps into Clause Form

Useful Meta-Theorem:
The Subformula Property

If $A$ is (an occurrence of) a subformula of $B$, and $\models A \Leftrightarrow C$, then $\models B \Leftrightarrow B\{C/A\}$
Translating Standard Wfps into Clause Form

Step 1

Eliminate occurrences of $\iff$ using

$$| = (A \iff B) \iff ((A \Rightarrow B) \land (B \Rightarrow A))$$

From: $(LivingThing \iff (Animal \lor Vegetable))$

To:

$((LivingThing \Rightarrow (Animal \lor Vegetable))$

$\land ((Animal \lor Vegetable) \Rightarrow LivingThing))$
Translation Step 2

Eliminate occurrences of $\Rightarrow$ using

$$\models (A \Rightarrow B) \iff (\neg A \lor B)$$

From:

$$((\text{LivingThing} \Rightarrow (\text{Animal} \lor \text{Vegetable})))$$
$$\land ((\text{Animal} \lor \text{Vegetable}) \Rightarrow \text{LivingThing}))$$

To:

$$((\neg \text{LivingThing} \lor (\text{Animal} \lor \text{Vegetable})))$$
$$\land ((\neg (\text{Animal} \lor \text{Vegetable}) \lor \text{LivingThing}))$$
Translation Step 3

Translate to *miniscope* form using

\[
\models \neg(A \land B) \iff (\neg A \lor \neg B) \\
\models \neg(A \lor B) \iff (\neg A \land \neg B) \\
\models \neg(\neg A) \iff A
\]

From:
\[
(((\neg LivingThing \lor (Animal \lor Vegetable)) \\
\land (\neg (Animal \lor Vegetable) \lor LivingThing))
\]

To:
\[
(((\neg LivingThing \lor (Animal \lor Vegetable)) \\
\land (((\neg Animal \land \neg Vegetable) \lor LivingThing))
\]

Page 164
Translation Step 4

CNF: Translate into Conjunctive Normal Form, using
\( \models (A \lor (B \land C)) \iff ((A \lor B) \land (A \lor C)) \)
\( \models ((B \land C) \lor A) \iff ((B \lor A) \land (C \lor A)) \)

From:
\( ((\neg \text{LivingThing} \lor (\text{Animal} \lor \text{Vegetable})) \land ((\neg \text{Animal} \land \neg \text{Vegetable}) \lor \text{LivingThing})) \)

To:
\( ((\neg \text{LivingThing} \lor (\text{Animal} \lor \text{Vegetable})) \land ((\neg \text{Animal} \lor \text{LivingThing}) \land (\neg \text{Vegetable} \lor \text{LivingThing}))) \)
Translation Step 5

Discard extra parentheses using the associativity of $\wedge$ and $\lor$.

From:
$$(((\neg LivingThing \lor (Animal \lor Vegetable)) \wedge ((\neg Animal \lor LivingThing) \wedge (\neg Vegetable \lor LivingThing))))$$

To:
$$(((\neg LivingThing \lor Animal \lor Vegetable) \wedge (\neg Animal \lor LivingThing) \wedge (\neg Vegetable \lor LivingThing))))$$
Translation Step 6

Turn each disjunction into a clause, and the conjunction into a set of clauses.

From:

\(((\neg \text{LivingThing} \lor \text{Animal} \lor \text{Vegetable}) \land (\neg \text{Animal} \lor \text{LivingThing}) \land (\neg \text{Vegetable} \lor \text{LivingThing}))\)

To:

\{\{\neg \text{LivingThing}, \text{Animal}, \text{Vegetable}\},
\{\neg \text{Animal}, \text{LivingThing}\},
\{\neg \text{Vegetable}, \text{LivingThing}\}\}
Use of Translation

\[ A_1, \ldots, A_n \models_{\text{Standard}} Q \]

iff

The translation of \( A_1 \land \cdots \land A_n \land \neg Q \) into a set of clauses

\[ \vdash \{ \} \]
To prove
\((LivingThing \iff Animal \lor Vegetable), (LivingThing \land \neg Animal) \models Vegetable\)

prover(20): (prove '((iff LivingThing (or Animal Vegetable))
  (and LivingThing (not Animal)))
  'Vegetable)

1  (LivingThing)  Assumption
2  ((not Animal)) Assumption
3  ((not Animal) LivingThing) Assumption
4  ((not Vegetable) LivingThing) Assumption
5  ((not LivingThing) Animal Vegetable) Assumption
6  ((not Vegetable)) From Query
Deleting 3 ((not Animal) LivingThing)
because it’s subsumed by 1 (LivingThing)
Deleting 4 ((not Vegetable) LivingThing)
because it’s subsumed by 1 (LivingThing)
prover Example, continued

1 (LivingThing) Assumption
2 ((not Animal)) Assumption
5 ((not LivingThing) Animal Vegetable) Assumption
6 ((not Vegetable)) From Query

7 ((not LivingThing) Animal) R,6,5,{}
Deleting 5 ((not LivingThing) Animal Vegetable) because it’s subsumed by 7 ((not LivingThing) Animal)
8 (Animal) R,7,1,{}
9 ((not LivingThing)) R,7,2,{}
10 nil R,9,1,{}

3 Predicate Logic Over Finite Models

3.1 CarPool World ................................................................. 174
3.2 The "Standard" Finite-Model Predicate Logic ............... 175
3.3 Clause Form Finite-Model Predicate Logic ................. 211
3.1 CarPool World

Propositional Logic

Tom drives Betty  Betty drives Tom
Tom is the driver  Betty is the driver
Tom is the passenger  Betty is the passenger

related only by the domain rules.

Predicate Logic

\[ \text{Drives}(\text{Tom}, \text{Betty}) \quad \text{Drives}(\text{Betty}, \text{Tom}) \]
\[ \text{Driver}(\text{Tom}) \quad \text{Driver}(\text{Betty}) \]
\[ \text{Passenger}(\text{Tom}) \quad \text{Passenger}(\text{Betty}) \]

shows two properties, one relation, and two individuals.
3.2 The “Standard”
Finite-Model Predicate Logic

1. Syntax ................................................................. 176
2. Substitutions .......................................................... 187
3. Semantics .............................................................. 190
4. Model Checking in Finite-Model Predicate Logic ............ 202

Page 175
3.2.1 Syntax of the “Standard”
Finite-Model Predicate Logic
Atomic Symbols

Individual Constants:

- Any letter of the alphabet (preferably early),
- any (such) letter with a numeric subscript,
- any character string not containing blanks nor other punctuation marks.

For example: $a$, $B_{12}$, $Tom$, $Tom’s_{-}mother{-}in{-}law$. 
Atomic Symbols, Part 2

Variables:

- Any letter of the alphabet (preferably late),
- any (such) letter with a numeric subscript.

For example: $u, v_6$. 
Predicate Symbols:

- Any letter of the alphabet (preferably late middle),
- any (such) letter with a numeric subscript,
- any character string not containing blanks.

For example: $P, Q_4, Drives$.

Each Predicate Symbol must have a particular **arity**.

Use superscript for explicit arity.

For example: $P^1, Drives^2, Q_2^3$
Atomic Symbols, Part 4

In any specific predicate logic language

   Individual Constants,
   Variables,
   Predicate Symbols

must be disjoint.

Set of individual constants and of predicate symbols must be finite.
Terms

- Every individual constant and variable is a term.
- Nothing else is a term.
Atomic Formulas

If $P^n$ is a predicate symbol of arity $n$, and $t_1, \ldots, t_n$ are terms, then $P^n(t_1, \ldots, t_n)$ is an atomic formula.

E.g.: $Passenger^1(Tom), Drives^2(Betty, y)$

(The superscript may be omitted if no confusion results.)
Well-Formed Formulas (wffs):

Every atomic formula is a wff.

If $P$ is a wff, then so is $(\neg P)$.

If $P$ and $Q$ are wffs, then so are

$(P \land Q)$  $(P \lor Q)$

$(P \Rightarrow Q)$  $(P \Leftrightarrow Q)$

If $P$ is a wff and $x$ is a variable,
then $\forall x(P)$ and $\exists x(P)$ are wffs.

Parentheses may be omitted or replaced by square brackets if no confusion results.

We will allow $(P_1 \land \cdots \land P_n)$ and $(P_1 \lor \cdots \lor P_n)$.

$\forall x(\forall y(P))$ may be abbreviated as $\forall x, y(P)$.

$\exists x(\exists y(P))$ may be abbreviated as $\exists x, y(P)$. 

Page 182
Quantifiers:

In $\forall x P$ and $\exists x P$

$\forall$ called the **universal quantifier**.

$\exists$ called the **existential quantifier**.

$P$ is called the **scope** of quantification.
Free and Bound Variables

Every occurrence of $x$ in $P$, not in the scope of some other occurrence of $\forall x$ or $\exists x$, is said to be free in $P$ and bound in $\forall xP$ and $\exists xP$.

Every occurrence of every variable other than $x$ that is free in $P$ is also free in $\forall xP$ and $\exists xP$.

\[
\forall x[P(x, y) \leftrightarrow [(\exists x \exists z Q(x, y, z)) \Rightarrow R(x, y)]]
\]
Open, Closed, and Ground

A wff with a free variable is called **open**.
A wff with no free variables is called **closed**,
An expression with no variables is called **ground**.
CarPpool World Domain Rules

PropositionalLogic

Betty is the driver ⇔ ¬Betty is the passenger

Tom is the driver ⇔ ¬Tom is the passenger

Betty drives Tom ⇒ Betty is the driver ∧ Tom is the passenger

Tom drives Betty ⇒ Tom is the driver ∧ Betty is the passenger

Tom drives Betty ∨ Betty drives Tom

PredicateLogic

∀x(Driver(x) ⇔ ¬Passenger(x))

∀x, y(Drives(x, y) ⇒ (Driver(x) ∧ Passenger(y)))

Drives(Tom, Betty) ∨ Drives(Betty, Tom)
3.2.2 Substitutions
Syntax

Pairs: \( t/v \) (Read: “t for v”)
- \( t \) is any term
- \( v \) is any variable

Substitutions: \( \{t_1/v_1, \ldots, t_n/v_n\} \)
- \( i \neq j \Rightarrow v_i \neq v_j \)
Terminology

\[ \sigma = \{t_1/v_1, \ldots, t_n/v_n\} \]

\( t_i \) is a term in \( \sigma \)

\( v_i \) is a variable of \( \sigma \)

Say \( t_i/v_i \in \sigma \) and \( v_i \in \sigma \),
but not \( t_i \in \sigma \)

Note: \( x \) is not a variable of \( \{x/y\} \),
i.e. \( x/y \in \{x/y\} \), \( y \in \{x/y\} \), \( x \not\in \{x/y\} \)
Substitution Application

For expression $A$ and substitution $\sigma = \{t_1/v_1, \ldots, t_n/v_n\}$

$A\sigma$: replace every free occurrence of each $v_i$ in $A$ by $t_i$

E.g.:

$P(x, y)\{x/y, y/x\} = P(y, x)$

$\forall x[P(x, y) \iff [(\exists x \exists z Q(x, y, z)) \Rightarrow R(x, y, z)]\{a/x, b/y, c/z\}$

$= \forall x[P(x, b) \iff [(\exists x \exists z Q(x, b, z)) \Rightarrow R(x, b, c)]]$
3.2.3 Semantics of Finite-Model Predicate Logic

Assumes a Finite Domain, $\mathcal{D}$, of

- individuals,
- sets of individuals,
- relations over individuals

Let $\mathcal{I}$ be the set of all individuals in $\mathcal{D}$. 

Page 190
Semantics of Individual Constants

$[a] = [a] = \text{some particular individual in } \mathcal{I}.$

There is no anonymous individual.
I.e. for every individual, $i$ in $\mathcal{I}$, there is an individual constant $c$ such that $[c] = [c] = i.$
Semantics of Predicate Symbols

Predicate Symbols:

- \([P^1]\) is some category/property of individuals of \(\mathcal{I}\).
- \([P^n]\) is some n-ary relation over \(\mathcal{I}\).
- \([P^1]\) is some particular subset of \(\mathcal{I}\).
- \([P^n]\) is some particular subset of the relation \(\mathcal{I} \times \cdots \times \mathcal{I}\), \(n\) times.
Intensional Semantics
of Ground Atomic Formulas

• If $P^1$ is some unary predicate symbol, and $t$ is some individual constant, then $[P^1(t)]$ is the proposition that $[t]$ is an instance of the category $[P^1]$ (or has the property $[P^1]$).

• If $P^n$ is some $n$-ary predicate symbol, and $t_1, \ldots, t_n$ are individual constants, then $[P^n(t_1, \ldots, t_n)]$ is the proposition that the relation $[P^n]$ holds among individuals $[t_1]$, and $[t_n]$. 
Extensional Semantics of Ground Atomic Formulas

- If $P^1$ is some unary predicate symbol, and $t$ is some individual constant, then $[P^1(t)]$ is True if $[t] \in [P^1]$, and False otherwise.

- If $P^n$ is some $n$-ary predicate symbol, and $t_1, \ldots, t_n$ are individual constants, then $[P^n(t_1, \ldots, t_n)]$ is True if $\langle [t_1], \ldots, [t_n] \rangle \in [P^n]$, and False otherwise.
Semantics of WFFs, Part 1

\[ \lnot P, \ (P \land Q), \ (P \lor Q), \ (P \Rightarrow Q), \ (P \Leftrightarrow Q) \]

are as they are in Propositional Logic.
Semantics of WFFs, Part 2

- $[\forall x P]$ is the proposition that every individual $i$ in $I$, with “name” $t_i$, satisfies $[P\{t_i/x\}]$.

- $[\exists x P]$ is the proposition that some individual $i$ in $I$, with “name” $t_i$, satisfies $[P\{t_i/x\}]$.

- $[\forall x P]$ is True if $[P\{t/x\}]$ is True for every individual constant, $t$. Otherwise, it is False.

- $[\exists x P]$ is True if there is some individual constant, $t$ such that $[P\{t/x\}]$ is True. Otherwise, it is False.
Intensional Semantics
of Individual Constants
In CarPool World

\[ Tom \] = Someone named Tom.
\[ Betty \] = Someone named Betty.
Intensional Semantics
of Individual Constants
In 4-Person CarPool World
(Call it 4pCarPool World)

\[ [Tom] = \text{Someone named Tom.} \]
\[ [Betty] = \text{Someone named Betty.} \]
\[ [John] = \text{Someone named John.} \]
\[ [Mary] = \text{Someone named Mary.} \]
Intensional Semantics
of Ground Atomic Wffs
In Both CarPool Worlds

Predicate Symbols:

\[Driver^1(x) = [x] \text{ is the driver of the/a car.}\]
\[Passenger^1(x) = [x] \text{ is the passenger of the/a car.}\]
\[Drives^2(x, y) = [x] \text{ drives } [y] \text{ to work.}\]
Extensional Semantics of One CarPool World Situation

\[ [Tom] = \text{Tom}. \]
\[ [Betty] = \text{Betty}. \]
\[ [Driver] = \{\text{Betty}\}. \]
\[ [Passenger] = \{\text{Tom}\}. \]
\[ [Drives] = \{\langle \text{Betty, Tom}\rangle\}. \]
Extensional Semantics of One 4pCarPool World Situation

\[ [Tom] = \text{Tom}. \]
\[ [Betty] = \text{Betty}. \]
\[ [John] = \text{John}. \]
\[ [Mary] = \text{Mary}. \]
\[ [Driver] = \{\text{Betty, John}\}. \]
\[ [Passenger] = \{\text{Mary, Tom}\}. \]
\[ [Drives] = \{\langle \text{Betty, Tom}\rangle, \langle \text{John, Mary}\rangle\}. \]
3.2.4 Model Checking
in Finite-Model Predicate Logic

- $n$ Individual Constants.

- Predicate $P^j$ yields $n^j$ ground atomic propositions.

- $k_j$ predicates of arity $j$ yields $\sum_j (k_j \times n^j)$ ground atomic propositions.

- So $2\sum_j (k_j \times n^j)$ situations (columns of truth table).

- CarPool World has $2^{(2\times2^1+1\times2^2)} = 2^8 = 256$ situations.

- 4pCarPool World has $2^{(2\times4^1+1\times4^2)} = 2^{24} = 16,777,216$ situations.

Page 203
Turning
Predicate Logic Over Finite Domains
Into Ground Predicate Logic

If $c_1, \ldots, c_n$ are the individual constants,

- Turn $\forall x P(x)$ into $P(c_1) \land \cdots \land P(c_n)$
- and $\exists x P(x)$ into $P(c_1) \lor \cdots \lor P(c_n)$
- E.g.:

  $\forall x \exists y (\text{Drives}(x, y))$  
  $\iff \exists y \text{Drives}(\text{Tom}, y) \land \exists y \text{Drives}(\text{Betty}, y)$  
  $\iff (\text{Drives}(\text{Tom}, \text{Tom}) \lor \text{Drives}(\text{Tom}, \text{Betty}))$  
  $\land (\text{Drives}(\text{Betty}, \text{Tom}) \lor \text{Drives}(\text{Betty}, \text{Betty}))$
Sorted Logic: A Digression

Introduce a hierarchy of sorts, \( s_1, \ldots, s_n \).

(A sort in logic is similar to a data type in programming.)

Assign each individual constant a sort.

Assign each variable a sort.

Declare the sort of each argument position of each predicate symbol.

An atomic formula, \( P^n(t_1, \ldots, t_n) \) is only syntactically valid if the sort of \( t_i \), for each \( i \), is the sort, or a subsort of the sort, declared for the \( i^{th} \) argument position of \( P^n \).
Predicate 2-Car CarPool World in Decreasoner

sort commuter
commuter Tom, Betty
sort car
car TomsCar, BettysCar

;;; [DrivesIn(x,y,c)] = [x] drives [y] to work in car [c].
predicate DrivesIn(commuter, commuter, car)

;;; [DriverOf(x,c)] = [x] is the driver of car [c].
predicate DriverOf(commuter, car)

;;; [PassengerIn(x,c)] = [x] is a passenger in car [c].
predicate PassengerIn(commuter, car)

Domain Rules of 2-Car CarPool World

;;; If someone’s a driver of one car, they’re not a passenger in any car.
;;; (And if someone’s a passenger in one car, they’re not driver of any car.)
[commuter][car1][car2](DriverOf(commuter, car1) -> !PassengerIn(commuter, car2)).

;;; If A drives B in car C, then A is the driver of and B is a passenger in C.
[commuter1][commuter2][car](DrivesIn(commuter1, commuter2, car)
-> DriverOf(commuter1, car)
& PassengerIn(commuter2, car)).

;;; Either Tom drives Betty in Tom’s car or Betty drives Tom in Betty’s car.
DrivesIn(Tom, Betty, TomsCar) | DrivesIn(Betty, Tom, BettysCar).

;;; Tom doesn’t drive Betty’s car, and Betty doesn’t drive Tom’s car.
!DriverOf(Tom, BettysCar) & !DriverOf(Betty, TomsCar).

;;; Neither Tom nor Betty is a passenger in their own car.
!PassengerIn(Tom, TomsCar) & !PassengerIn(Betty, BettysCar).
Decreasoner Produces Two Models

The True propositions:

model 1:
DriverOf(Betty, BettysCar).
DrivesIn(Betty, Tom, BettysCar).
PassengerIn(Tom, BettysCar).

model 2:
DriverOf(Tom, TomsCar).
DrivesIn(Tom, Betty, TomsCar).
PassengerIn(Betty, TomsCar).
Use of Predicate-Wang

cl-user(12): (wang:predicate-entails

  '( (forall (x y)
      (if (Drives x y)
          (and (Driver x) (Passenger y)))
          (Drives Betty Tom))
    '(and (Driver Betty) (Passenger Tom))
    '(Betty Tom))

  t
3.3 Clause Form
Finite-Model Predicate Logic

1. Syntax ................................................................. 212
2. Semantics .............................................................. 213
3. Model Finding .......................................................... 215
3.3.1 Syntax of Clause Form
Finite-Model Predicate Logic

Individual constants, predicate symbols, terms, and ground atomic formulas as in standard finite-model predicate logic.
(Variables are not needed.)

Literals, clauses and sets of clauses as in propositional clause form logic.
3.3.2 Semantics of Clause Form
Finite-Model Predicate Logic

- Individual constants, predicate symbols, terms, and ground atomic formulas as in standard finite-model predicate logic.
- Ground literals, ground clauses, and sets of ground clauses as in propositional clause form logic.
Translation of Standard Form to Clause Form
Finite-Model Predicate Calculus

1. Eliminate quantifiers as when using model checking.
2. Translate into clause form as for propositional logic.
3.3.3 Model Finding: GSAT

procedure GSAT($C$, $tries$, $flips$)

    input: a set of clauses $C$, and positive integers $tries$ and $flips$

    output: a model satisfying $C$, or failure

    for $i := 1$ to $tries$ do
        $M :=$ a randomly generated truth assignment
        for $j := 1$ to $flips$ do
            if $M | = C$ then return $M$
        $p :=$ an atom such that a change in its truth
            assignment gives the largest increase in the total
            number of clauses in $C$ that are satisfied by $M$
            $M := M$ with the truth assignment of $p$ reversed
        end for
    end for

    return “no satisfying interpretation found”

A Pedagogical Implementation of GSAT

/projects/shapiro/CSE563/gsat.cl

Uses wang:expand to eliminate quantifiers,

and prover:clauseForm to translate to clause form.
Example GSAT Run

cl-user(1): :ld /projects/shapiro/CSE563/gsat
...
cl-user(2): :pa gsat
gsat(3): (gsat ’((forall x (iff (Driver x) (not (Passenger x)))))
         (forall (x y) (if (Drives x y) (and (Driver x) (Passenger y))))
         (or (Drives Tom Betty) (Drives Betty Tom))
         (Driver Betty))
         30 6)

A satisfying model (found on try 17) is
(((Driver Tom) nil)    ((Passenger Tom) t)
 ((Drives Betty Betty) nil)  ((Drives Tom Tom) nil)
 ((Drives Betty Tom) t)    ((Drives Tom Betty) nil)
 ((Driver Betty) t)       ((Passenger Betty) nil))
#<equal hash-table with 8 entries @ #x4a64dca>
Using GSAT to Find
The Value of a Wff in a KB

gsat(19): (ask '(and (Drives Betty Tom) (Passenger Tom))
   '(((forall x (iff (Driver x) (not (Passenger x)))))
    (forall (x y) (if (Drives x y) (and (Driver x) (Passenger y))
    (or (Drives Tom Betty) (Drives Betty Tom))
    (Driver Betty)))
   30 6)

A satisfying model (found on try 19) is
(((Drives Tom Tom) nil) ((Drives Betty Tom) t)
 ((Driver Betty) t) ((Passenger Tom) t)
 ((Drives Tom Betty) nil) ((Driver Tom) nil)
 ((Drives Betty Betty) nil) ((Passenger Betty) nil))

(and (Drives Betty Tom) (Passenger Tom)) is True in a model of the KB.

Page 218
Model Finding: Walksat
A More Efficient Version of GSAT

DIMACS FORMAT:
Code each atomic formula as a positive integer:
c 1 Drives(Tom, Betty) Tom drives Betty to work.
c 2 Drives(Betty, Tom) Betty drives Tom to work.
c 3 Driver(Tom) Tom is the driver of the car.
c 4 Driver(Betty) Betty is the driver of the car.
c 5 Passenger(Tom) Tom is the passenger of the car.
c 6 Passenger(Betty) Betty is the passenger of the car.
DIMACS cont’d

Code each clause as a set ± integers, terminated by 0:

c ((¬ (Driver Tom)) (¬ (Passenger Tom)))
-3 -5 0

c ((¬ (Driver Betty)) (¬ (Passenger Betty)))
-4 -6 0

c ((Passenger Tom) (Driver Tom))
5 3 0

c ((Passenger Betty) (Driver Betty))
6 4 0

c ((¬ (Drives Tom Betty)) (Driver Tom))
-1 3 0

c ((¬ (Drives Betty Tom)) (Driver Betty))
-2 4 0

c ((¬ (Drives Tom Betty)) (Passenger Betty))
-1 6 0

c ((¬ (Drives Betty Tom)) (Passenger Tom))
-2 5 0

c ((Drives Tom Betty) (Drives Betty Tom))
1 2 0

c ((Driver Betty))
4 0

  v 4  
  v 5  
  v -6
Model Finding: Decreasoner

Decreasoner translates sorted finite-model predicate logic wffs into DIMACS clause form.

Decreasoner gives set of clauses to Relsat.

Relsat systematically searches all models. It either:

- reports that there are no satisfying models;
- returns up to MAXMODELS (currently 100) satisfying models;
- or gives up.

If Relsat gives up, Decreasoner gives set of clauses to Walksat. It either:

- returns some satisfying models;
- or returns some “near misses”;
- or gives up.
Decreasoner, Walksat, and “Near Misses”

“Let’s say that an ”N-near miss model of a SAT problem” is a truth assignment that satisfies all but N clauses of the problem. Walksat provides the command-line option:

\[-\text{target } N = \text{succeed if N or fewer clauses unsatisfied}\]

If relsat produces no models, the Discrete Event Calculus Reasoner invokes walksat with \(-\text{target 1}\). If this fails, it invokes walksat with \(-\text{target 2}\). If this fails, it gives up. One or two unsatisfied clauses may be helpful for debugging. In my experience, three or more unsatisfied clauses are less useful.

If you get a near miss model, it’s often useful to rerun the Discrete Event Calculus Reasoner. Because walksat is stochastic, you may get back a different near miss model, and that near miss model may be more informative than the previous one.”

[Erk Mueller, email to scs, 1/12/2007]

2. Semantics ............................................................ 240
3. Model Checking ......................................................... 252
4. Hilbert-Style Proof Theory ........................................... 253
5. Fitch-Style Proof Theory ............................................. 255
4.2.1 Syntax of the “Standard”
First-Order Predicate Logic
Atomic Symbols

Individual Constants:

- Any letter of the alphabet (preferably early),
- any (such) letter with a numeric subscript,
- any character string not containing blanks nor other punctuation marks.

For example: \( a, B_{12}, Tom, Tom’s_{mother-in-law} \).
Atomic Symbols, Part 2

Arbitrary Individuals:
  • Any letter of the alphabet (preferably early),
  • any (such) letter with a numeric subscript.

Indefinite Individuals:
  • Any letter of the alphabet (preferably early),
  • any (such) letter with a numeric subscript.
Variables:

- Any letter of the alphabet (preferably late),
- any (such) letter with a numeric subscript.

For example: $x, y_6$. 
Atomic Symbols, Part 4

Function Symbols:

- Any letter of the alphabet (preferably early middle)
- any (such) letter with a numeric subscript
- any character string not containing blanks.

For example: $f$, $g_2$, $motherOf$, $familyOf$. 
Predicate Symbols:

- Any letter of the alphabet (preferably late middle),
- any (such) letter with a numeric subscript,
- any character string not containing blanks.

For example: $P, Q_4, Passenger, Drives$. 
Each Function Symbol and Predicate Symbol must have a particular \textit{arity}.

Use superscript for explicit arity.

For example: \textit{motherOf}^{1}, \textit{Drives}^{2}, \textit{familyOf}^{2}, \textit{g}^{3}_{2}
In any specific predicate logic language

Individual Constants,
Arbitrary Individuals,
Indefinite Individuals,
Variables,
Function Symbols,
Predicate Symbols

must be disjoint.
Terms

• Every individual constant, every arbitrary individual, every indefinite individual, and every variable is a term.

• If $f^n$ is a function symbol of arity $n$, and $t_1, \ldots, t_n$ are terms, then $f^n(t_1, \ldots, t_n)$ is a term.
  (The superscript may be omitted if no confusion results.)
  For example: $familyOf^2(Tom, motherOf^1(Betty))$

• Nothing else is a term.
Atomic Formulas

If $P^n$ is a predicate symbol of arity $n$,

and $t_1, \ldots, t_n$ are terms,

then $P^n(t_1, \ldots, t_n)$ is an atomic formula.
E.g.: $\text{ChildIn}^2(Betty, \text{familyOf}^2(Tom, \text{motherOf}^1(Betty)))$

(The superscript may be omitted if no confusion results.)
Well-Formed Formulas (wffs):

- Every atomic formula is a wff.
- If $P$ is a wff, then so is $\neg(P)$.
- If $P$ and $Q$ are wffs, then so are
  
  $$(P \land Q) \quad (P \lor Q)$$

  $$(P \Rightarrow Q) \quad (P \Leftrightarrow Q)$$

- If $P$ is a wff and $x$ is a variable, then $\forall x(P)$ and $\exists x(P)$ are wffs.
  Parentheses may be omitted or replaced by square brackets if no confusion results.

We will allow $(P_1 \land \cdots \land P_n)$ and $(P_1 \lor \cdots \lor P_n)$.

$\forall x(\forall y(P))$ may be abbreviated as $\forall x, y(P)$.

$\exists x(\exists y(P))$ may be abbreviated as $\exists x, y(P)$.
Open, Closed, Ground, and Free For

A wff with a free variable is called **open**.

A wff with no free variables is called **closed**.

An expression with no variables is called **ground**.

Note: expressions now include functional terms.

A term $t$ is **free for** a variable $x$ in the wff $A(x)$ if no free occurrence of $x$ in $A(x)$ is in the scope of any quantifier $\forall y$ or $\exists y$ whose variable $y$ is in $t$.

E.g., $f(a, y, b)$ is free for $x$ in $\forall u \exists v (A(x, u) \lor B(x, v))$ but $f(a, y, b)$ is not free for $x$ in $\forall u \exists y (A(x, u) \lor B(x, y))$.

Remedy: rename $y$ in $A(x)$. E.g., $\forall u \exists v (A(x, u) \lor B(x, v))$
Substitutions with Functional Terms

Notice, terms may now include functional terms.

E.g.:

\[ P(x, f(y), z)\{a/x, g(b)/y, f(a)/z\} = P(a, f(g(b)), f(a)) \]
4.2.2 Semantics of the “Standard” First-Order Predicate Logic

Assumes a **Domain**, $\mathcal{D}$, of

- individuals,
- functions on individuals,
- sets of individuals,
- relations on individuals

Let $\mathcal{I}$ be set of all individuals in $\mathcal{D}$. 
Semantics of Constants

Individual Constant:

\[[a] = [a] = \text{some particular individual in } \mathcal{I}.\]

Arbitrary Individual:

\[[a] = [a] = \text{a representative of all individuals in } \mathcal{I}. \text{ Everything True about all of them, is True of it.}\]

Indefinite Individual:

\[[s] = [s] = \text{a representative of some individual in } \mathcal{I}, \text{ but it’s unspecified which one.}\]

There is no anonymous individual.

I.e. for every individual, \(i\) in \(\mathcal{I}\), there is a ground term \(t\) such that \([t] = i.\) (But not necessarily an individual constant.)
Intensional Semantics of Functional Terms

**Function Symbols:** $[f^n]$ is some n-ary function in $\mathcal{D}$,

**Functional Terms:**

If $f^n$ is some function symbol and $t_1, \ldots, t_n$ are ground terms, then $[f^n(t_1, \ldots, t_n)]$ is a description of the individual in $\mathcal{I}$ that is the value of $[f^n]$ on $[t_1]$, and $\ldots$, and $[t_n]$. 
Extensional Semantics of Functional Terms

Function Symbols: $[f^n]$ is some function in $D$,

$[f^n]: \mathcal{I} \times \cdots \times \mathcal{I} \rightarrow \mathcal{I}$

$n$ times

Functional Terms:
If $f^n$ is some function symbol and $t_1, \ldots, t_n$ are ground terms,
then $[f^n(t_1, \ldots, t_n)] = [f^n]( [t_1], \ldots, [t_n] )$. 
Semantics of Predicate Symbols

Predicate Symbols:

- $[P^1]$ is some category/property of individuals of $\mathcal{I}$
- $[P^n]$ is some n-ary relation in $\mathcal{D}$.
- $[P^1]$ is some particular subset of $\mathcal{I}$.
- $[P^n]$ is some particular subset of the relation $\underbrace{\mathcal{I} \times \cdots \times \mathcal{I}}_{n \text{ times}}$. 
• If $P^1$ is some unary predicate symbol, and $t$ is some ground term, then $[P^1(t)]$ is the proposition that $[t]$ is an instance of the category $[P^1]$ (or has the property $[P^1]$).

• If $P^n$ is some $n$-ary predicate symbol, and $t_1, \ldots, t_n$ are ground terms, then $[P^n(t_1, \ldots, t_n)]$ is the proposition that the relation $[P^n]$ holds among individuals $[t_1], \text{ and } \ldots, \text{ and } [t_n]$.
Extensional Semantics of Ground Atomic Formulas

Atomic Formulas:

- If $P^1$ is some unary predicate symbol, and $t$ is some ground term, then $[P^1(t)]$ is True if $[t] \in [P^1]$, and False otherwise.

- If $P^n$ is some $n$-ary predicate symbol, and $t_1,\ldots, t_n$ are ground terms, then $[P^n(t_1,\ldots, t_n)]$ is True if $\langle[[t_1]], \ldots, [[t_n]]\rangle \in [P^n]$, and False otherwise.
Semantics of WFFs, Part 1

$\neg P$, $P \land Q$, $P \lor Q$, $P \Rightarrow Q$, $P \Leftrightarrow Q$

$\neg P$, $P \land Q$, $P \lor Q$, $P \Rightarrow Q$, and $P \Leftrightarrow Q$

are as they are in Propositional Logic.
Semantics of WFFs, Part 2

- \( \forall x P \) is the proposition that every individual \( i \) in \( \mathcal{I} \), with name or description \( t_i \), satisfies \( [P\{t_i/x\}] \).

- \( \exists x P \) is the proposition that some individual \( i \) in \( \mathcal{I} \), with name or description \( t_i \), satisfies \( [P\{t_i/x\}] \).

- \( [\forall x P] \) is True if \( [P\{t/x\}] \) is True for every ground term, \( t \). Otherwise, it is False.

- \( [\exists x P] \) is True if there is some ground term, \( t \) such that \( [P\{t/x\}] \) is True. Otherwise, it is False.
Intensional Semantics
of a 2-Car CarPool World 1

Individual Constants:

\[ Tom \] = The individual named Tom.

\[ Betty \] = The individual named Betty.

Functions:

\[ \text{motherOf}(x) \] = The mother of \([x]\).
Intensional Semantics
of a 2-Car CarPool World 2

Predicates:

\[ Driver^1(x) = [x] \text{ is the driver of a car.} \]
\[ Passenger^1(x) = [x] \text{ is the passenger in a car.} \]
\[ Drives^2(x, y) = [x] \text{ drives } [y] \text{ in a car.} \]
Extensional Semantics of a 2-Car CarPool World Situation

\([Tom] = \) the individual named Tom.
\([Betty] = \) the individual named Betty.
\([motherOf] = \{\langle [Betty], [motherOf(Betty)] \rangle,\]
\(\langle [Tom], [motherOf(Tom)] \rangle \}\}.
\([Driver] = \{[motherOf(Betty)], [motherOf(Tom)]\}\}.
\([Passenger] = \{[Betty], [Tom]\}\}.
\([Drives] = \{\langle [motherOf(Betty)], [Betty] \rangle,\]
\(\langle [motherOf(Tom)], [Tom] \rangle \}\}.\)
4.2.3 Model Checking in Full FOL

$n$ Individual Constants.

At least one function yields $\infty$ terms. *Decreasoner.*

E.g., $\text{motherOf(} \text{Tom} \text{)}, \text{motherOf(} \text{motherOf(} \text{Tom} \text{)} \text{)}, \\
\text{motherOf(} \text{motherOf(} \text{motherOf(} \text{Tom} \text{)} \text{)} \text{)} \ldots.$

So $\infty$ ground atomic propositions.

So $\infty$ situations (columns of truth table).

So can’t create entire truth table.

Can’t do model checking
by expanding quantified expressions
into Boolean combination of ground wffs.

There still could be a finite domain if at least one individual in $\mathcal{I}$
has an $\infty$ number of terms describing it, but we’ll assume not.
4.2.4 Hilbert-Style Proof Theory for First-Order Predicate Logic

\[(A1). \ (A \Rightarrow (B \Rightarrow A))\]

\[(A2). \ (((A \Rightarrow (B \Rightarrow C)) \Rightarrow ((A \Rightarrow B) \Rightarrow (A \Rightarrow C))))\]

\[(A3). \ ((\neg B \Rightarrow \neg A) \Rightarrow ((\neg B \Rightarrow A) \Rightarrow B))\]

\[(A4). \ \forall x A \Rightarrow A\{t/x\}\]

where \( t \) is any term free for \( x \) in \( A(x) \).

\[(A5). \ (\forall x (A \Rightarrow B)) \Rightarrow (A \Rightarrow \forall x B)\]

if \( A \) is a wff containing no free occurrences of \( x \).
Hilbert-Style Rules of Inference for “Standard” First-Order Predicate Logic

\[ \begin{align*} 
A, A & \Rightarrow B \\
\hline 
B \\
\end{align*} \]

\[ \begin{align*} 
A \\
\hline 
\forall x A \\
\end{align*} \]

Note: \( \exists x A \) is just an abbreviation of \( \neg \forall x \neg A \).
Additional Rules of Inference for $\forall$

\[\begin{array}{c|c}
  i & a \quad \text{Arb I} \\
   & \quad \\
  j & P(a) \\
  \hline
  j + 1 & \forall x P\{x/a\} \quad \forall I, i-j \\
\end{array}\]

\[\begin{array}{c|c}
  i & \forall x P(x) \\
  i + 1 & P\{t/x\} \quad \forall E, i \\
\end{array}\]

Where $a$ is an arbitrary individual not otherwise used in the proof, and $t$ is any term, whether or not used elsewhere in the proof, that is free for $x$ in $P(x)$. 
Example of $\forall$ Rules

To prove $\forall x(P(x) \Rightarrow Q(x)) \Rightarrow (\forall xP(x) \Rightarrow \forall xQ(x))$

1. $\forall x(P(x) \Rightarrow Q(x))$ Hyp
2. $\forall xP(x)$ Hyp
3. $a$ Arb I
4. $\forall xP(x)$ Reit, 2
5. $P(a)$ $\forall E$, 4
6. $\forall x(P(x) \Rightarrow Q(x))$ Reit, 1
7. $P(a) \Rightarrow Q(a)$ $\forall E$, 6
8. $Q(a)$ $\Rightarrow E$, 5, 7
9. $\forall xQ(x)$ $\forall I$, 3–8
10. $\forall xP(x) \Rightarrow \forall xQ(x)$ $\Rightarrow I$, 2–9
11. $\forall x(P(x) \Rightarrow Q(x)) \Rightarrow (\forall xP(x) \Rightarrow \forall xQ(x))$ $\Rightarrow I$, 1–10
Additional Rules of Inference for \( \exists \)

\[
\begin{array}{c|c}
  i & \exists x P(x) \\
  i + 1 & \exists x P(x) \quad \exists I, i \\
  j & P\{a/x\} \quad \text{Indef \, I, \, i} \\
  k & Q \\
  k + 1 & Q \quad \exists E, j-k \\
\end{array}
\]

Where \( P(x) \) is the result of replacing some or all occurrences of \( t \) in \( P(t) \) by \( x \),
\( t \) is free for \( x \) in \( P(x) \);
\( a \) is an indefinite individual not otherwise used in the proof,
\( P(a/x) \) is the result of replacing all occurrences of \( x \) in \( P(x) \) by \( a \),
and there is no occurrence of \( a \) in \( Q \). (Compare \( \exists E \) to \( \forall E \).)
Example of $\exists$ Rules

To prove $\exists x (P(x) \land Q(x)) \Rightarrow (\exists x P(x) \land \exists x Q(x))$

1. $\exists x (P(x) \land Q(x))$  \hspace{1cm} Hyp
2. $P(a) \land Q(a)$  \hspace{1cm} Indef I, 1
3. $P(a)$  \hspace{1cm} $\land$E, 2
4. $\exists x P(x)$  \hspace{1cm} $\exists$I, 3
5. $\exists x P(x)$  \hspace{1cm} $\exists$E, 2–4
6. $P(b) \land Q(b)$  \hspace{1cm} Indef I, 1
7. $Q(b)$  \hspace{1cm} $\land$E, 5
8. $\exists x Q(x)$  \hspace{1cm} $\exists$I, 6
9. $\exists x Q(x)$  \hspace{1cm} $\exists$E, 5–7
10. $\exists x P(x) \land \exists x Q(x)$  \hspace{1cm} $\land$I, 5,9
11. $\exists x (P(x) \land Q(x)) \Rightarrow (\exists x P(x) \land \exists x Q(x))$  \hspace{1cm} $\Rightarrow$I, 1–10

4.3 Clause-Form First-Order Predicate Logic

1. Syntax ................................................................. 261
2. Semantics ............................................................. 268
3. Proof Theory ......................................................... 270
4. Resolution Refutation ........................................... 291
4.3.1 Syntax of Clause-Form First-Order Predicate Logic

Atomic Symbols

Individual Constants:

- Any letter of the alphabet (preferably early),
- any (such) letter with a numeric subscript,
- any character string not containing blanks nor other punctuation marks.

For example: $a$, $B_{12}$, $Tom$, $Tom’s\_mother\_in\_law$.

Skolem Constants: Look like individual constants.
Atomic Symbols, Part 2

Variables:

- Any letter of the alphabet (preferably late),
- any (such) letter with a numeric subscript.

For example: $u, v_6$. 
Atomic Symbols, Part 3

Function Symbols:

• Any letter of the alphabet (preferably early middle)
• any (such) letter with a numeric subscript
• any character string not containing blanks.

For example: \( f, g_2 \).
Use superscript for explicit arity.

Skolem Function Symbols: Look like function symbols.
Atomic Symbols, Part 4

Predicate Symbols:

• Any letter of the alphabet (preferably late middle),
• any (such) letter with a numeric subscript,
• any character string not containing blanks.

For example: \( P, Q_4, odd \).
Use superscript for explicit arity.
Terms

• Every individual constant, every Skolem constant, and every variable is a term.

• If $f^n$ is a function symbol or Skolem function symbol of arity $n$, and $t_1, \ldots, t_n$ are terms, then $f^n(t_1, \ldots, t_n)$ is a term. (The superscript may be omitted if no confusion results.)

• Nothing else is a term.
Atomic Formulas

If $P^n$ is a predicate symbol of arity $n$,

and $t_1, \ldots, t_n$ are terms,

then $P^n(t_1, \ldots, t_n)$ is an atomic formula.

(The superscript may be omitted if no confusion results.)
Literals and Clauses

**Literals:** If $P$ is an atomic formula,
then $P$ and $\neg P$ are literals.

**Clauses:** If $L_1, \ldots, L_n$ are literals,
then the set \{ $L_1, \ldots, L_n$ \} is a clause.

**Sets of Clauses:** If $C_1, \ldots, C_n$ are clauses,
then the set \{ $C_1, \ldots, C_n$ \} is a set of clauses.
4.3.2 Semantics of Clause-Form
First-Order Predicate Logic

- Individual Constants, Function Symbols, Predicate Symbols, Ground Terms, and Ground Atomic Formulas as for Standard FOL.
- Skolem Constants are like indefinite individuals.
- Skolem Function Symbols are like indefinite function symbols.
- Ground Literals, Ground Clauses, and Sets of Clauses as for Clause-Form Propositional Logic.
If clause $C$ contains variables $v_1, \ldots, v_n$, then $C\{t_1/v_1, \ldots, t_n/v_n\}$ is a ground instance of $C$ if it contains no more variables.

If $C$ is an open clause, $[[C]]$ is True if every ground instance of $C$ is True. Otherwise, it is False.

That is, variables take on universal interpretation, with scope being the clause.
4.3.3 Proof Theory of Clause-Form FOL

Notion of Proof: None!

Notion of Derivation: A set of clauses constitutes a derivation.

Assumptions: The derivation is initialized with a set of assumption clauses $A_1, \ldots, A_n$.

Rule of Inference: A clause may be added to a set of clauses if justified by a rule of inference.

Derived Clause: If clause $Q$ has been added to a set of clauses initialized with the set of assumption clauses $A_1, \ldots, A_n$ by one or more applications of resolution, then $A_1, \ldots, A_n \vdash Q$. 
Clause-Form FOL Rules of Inference
Version 1

Resolution: \[
\begin{array}{c}
\{P, L_1, \ldots, L_n\}, \{-P, L_{n+1}, \ldots, L_m\} \\
\{L_1, \ldots, L_n, L_{n+1}, \ldots, L_m\}
\end{array}
\]

Universal Instantiation (temporary): \[
\begin{array}{c}
C \\
C\sigma
\end{array}
\]
Example Derivation

1. \( \{\neg Drives(x, y), Driver(x)\} \)  
   Assumption

2. \( \{\neg Driver(z), \neg Passenger(z)\} \)  
   Assumption

3. \( \{Drives(motherOf(Tom), Tom)\} \)  
   Assumption

4. \( \{\neg Drives(motherOf(Tom), Tom), \)
   
   \( Driver(motherOf(Tom))\} \)  
   \( UI, 1, \{motherOf(Tom)/x, Tom/y\} \)

5. \( \{Driver(motherOf(Tom))\} \)  
   \( R, 3, 4 \)

6. \( \{\neg Driver(motherOf(Tom)), \)
   
   \( \neg Passenger(motherOf(Tom))\} \)  
   \( UI, 2, \{motherOf(Tom)/z\} \)

7. \( \{\neg Passenger(motherOf(Tom))\} \)  
   \( R, 5, 6 \)
Motivation for a Shortcut

\[\{P(x), L_1(x), \ldots, L_n(x)\} \quad \{\neg P(y), L_{n+1}(y), \ldots, L_m(y)\}\]

\[\downarrow \{a/x, a/y\} \quad \downarrow \{a/x, a/y\}\]

\[\{P(a), L_1(a), \ldots, L_n(a)\} \quad \{\neg P(a), L_{n+1}(a), \ldots, L_m(a)\}\]

\[\{L_1(a), \ldots, L_n(a), L_{n+1}(a), \ldots, L_m(a)\}\]
Most General Unifier

A most general unifier (mgu), of atomic formulas $A$ and $B$ is a substitution, $\mu$, such that $A\mu = B\mu = a$ common instance of $A$ and $B$ and such that every other common instance of $A$ and $B$ is an instance of it.

I.e., $A\mu = B\mu =$ a most general common instance of $A$ and $B$.

Example:

Unifier of $P(a, x, y)$ and $P(u, b, v)$ is $\{a/u, b/x, c/y, c/v\}$ giving $P(a, b, c)$

But more general is $\{a/u, b/x, y/v\}$ giving $P(a, b, y)$
Clause-Form FOL Rules of Inference  
Version 2

\[ \{A, L_1, \ldots, L_n\}, \{\neg B, L_{n+1}, \ldots, L_m\} \]

Resolution:  

\[ \{L_1\mu, \ldots, L_n\mu, L_{n+1}\mu, \ldots, L_m\mu\} \]

where \( \mu \) is an mgu of \( A \) and \( B \).
Assume two parent clauses have no variables in common.
Example Derivation Revisited

1. \{¬Drives(x, y), Driver(x)\}  Assumption
2. \{¬Driver(z), ¬Passenger(z)\}  Assumption
3. \{Drives(motherOf(Tom), Tom)\}  Assumption
4. \{Driver(motherOf(Tom))\}  \(R, 1, 3, \{\text{motherOf(Tom)}/x, \text{Tom}/y\}\)
5. \{¬Passenger(motherOf(Tom))\}  \(R, 2, 4, \{\text{motherOf(Tom)}/z, \}\)
Unification

To find the mgu of $\mathcal{A}$ and $\mathcal{B}$.

Some Examples:

<table>
<thead>
<tr>
<th>$\mathcal{A}$</th>
<th>$\mathcal{B}$</th>
<th>mgu</th>
<th>mgci</th>
</tr>
</thead>
<tbody>
<tr>
<td>$P(a, b)$</td>
<td>$P(a, b)$</td>
<td>${}$</td>
<td>$P(a, b)$</td>
</tr>
<tr>
<td>$P(a)$</td>
<td>$P(b)$</td>
<td>FAIL</td>
<td></td>
</tr>
<tr>
<td>$P(a, x)$</td>
<td>$P(y, b)$</td>
<td>${a/y, b/x}$</td>
<td>$P(a, b)$</td>
</tr>
<tr>
<td>$P(a, x)$</td>
<td>$P(y, g(y))$</td>
<td>${a/y, g(a)/x}$</td>
<td>$P(a, g(a))$</td>
</tr>
<tr>
<td>$P(x, f(x))$</td>
<td>$P(y, y)$</td>
<td>FAIL (occurs check)</td>
<td></td>
</tr>
</tbody>
</table>

Page 277
Substitution Composition

\[ P\sigma \tau = (P\sigma)\tau = P(\sigma \circ \tau) \]

Let \( \sigma = \{t_1/v_1, \ldots, t_n/v_n\} \)

\[ \sigma \circ \tau = \{t_1\tau/v_1, \ldots, t_n\tau/v_n\} \uplus \tau \]

\[ \sigma \uplus \tau = \sigma \cup \{t/v \mid (t/v \in \tau) \land v \notin \sigma\} \]

E.g.: \( \{x/y, y/z\} \circ \{u/y, v/w\} = \{x/y, u/z, v/w\} \)

Page 289
Program Assertion

If original $A$ and $B$ have no variables in common,
then throughout the above program
no substitution will have one of its variables occurring in one of its terms.
Therefore, for any expression $E$ and any substitution $\sigma$ formed in
the above program, $E\sigma\sigma = E\sigma$. 

Page 290
4.3.4 Resolution Refutation

Example

To decide if
\{\neg Drives(x, y), Driver(x)\}, \{\neg Driver(x), \neg Passenger(x)\},
\{Drives(motherOf(Tom), Betty)\}
\models \{\neg Passenger(motherOf(Tom))\}

1. \{\neg Drives(x_1, y_1), Driver(x_1)\}  Assumption
2. \{\neg Driver(x_2), \neg Passenger(x_2)\}  Assumption
3. \{Drives(motherOf(Tom), Betty)\}  Assumption
4. \{Passenger(motherOf(Tom))\}  From query
5. \{\neg Driver(motherOf(Tom))\}  R, 2, 5, \{motherOf(Tom)/x_2\}
6. \{\neg Drives(motherOf(Tom), y_7)\}  R, 1, 6, \{motherOf(Tom)/x_1\}
7. {}  R, 3, 7, \{Betty/y_7\}
Example Using prover

prover(21): (prove '(((or (not (Drives ?x ?y)) (Driver ?x))
 (or (not (Driver ?x)) (not (Passenger ?x)))
 (Drives (motherOf Tom) Betty))
 ')(not (Passenger (motherOf Tom))))

1 ((Drives (motherOf Tom) Betty)) Assumption
2 ((not (Drives ?3 ?5)) (Driver ?3)) Assumption
3 ((not (Driver ?9)) (not (Passenger ?9))) Assumption
4 ((Passenger (motherOf Tom))) From Query
5 ((not (Driver (motherOf Tom)))) R,4,3,{(motherOf Tom)/?9}
6 ((not (Drives (motherOf Tom) ?86))) R,5,2,{(motherOf Tom)/?3}
7 nil R,6,1,{Betty/?86}
QED
Example Using snark

snark-user(84): (initialize)
snark-user(85): (assert '(or (not (Drives ?x ?y)) (Driver ?x)))
snark-user(86): (assert '(or (not (Driver ?x))
    (not (Passenger ?x))))
snark-user(87): (assert '(Drives (motherOf Tom) Betty))
snark-user(88): (prove '(not (Passenger (motherOf Tom)))))
(Refutation
(Row 1 (or (not (Drives ?x ?y)) (Driver ?x)) assertion)
(Row 2 (or (not (Driver ?x)) (not (Passenger ?x))) assertion)
(Row 3 (Drives (motherOf Tom) Betty) assertion)
(Row 4 (Passenger (motherOf Tom)) ~conclusion)
(Row 5 (not (Driver (motherOf Tom))) (resolve 2 4))
(Row 6 (not (Drives (motherOf Tom) ?x)) (resolve 5 1))
(Row 7 false (resolve 6 3))
)
:proof-found
Resolution Refutation is Incomplete for FOL

1. \{P(u), P(v)\}

2. \{\neg P(x), \neg P(y)\}

3. \{P(w), \neg P(z)\} \quad R, 1, 2, \{u/x, w/v, z/y\}

\vdots
Clause-Form FOL Rules of Inference
Version 3 (Last)

Resolution: \[
\begin{array}{c}
\{A, L_1, \ldots, L_n\}, \{\neg B, L_{n+1}, \ldots, L_m\} \\
\rightarrow \\
\{L_1\mu, \ldots, L_n\mu, L_{n+1}\mu, \ldots, L_m\mu\}
\end{array}
\]
where \(\mu\) is an mgu of \(A\) and \(B\).

Factoring: \[
\begin{array}{c}
\{A, B, L_1, \ldots, L_n\} \\
\rightarrow \\
\{A\mu, L_1\mu, \ldots, L_n\mu\}
\end{array}
\]
where \(\mu\) is an mgu of \(A\) and \(B\).
(Note: Special case of UI.)
Resolution Refutation with Factoring is Complete

If $A_1, \ldots, A_n \models Q$, then $A_1, \ldots, A_n, \neg Q \vdash_{R+F} \{}$.

For example,

1. $\{P(u), P(v)\}$
2. $\{\neg P(x), \neg P(y)\}$
3. $\{P(w)\}$ $F, 1, \{w/u, w/v\}$
4. $\{\neg P(z)\}$ $F, 2, \{z/x, z/y\}$
5. $\{}$ $R, 3, 4, \{w/z\}$

However, resolution refutation with factoring is still not a decision procedure—it is a semi-decision procedure.
Factoring (Condensing) by snark

SNARK has both factoring and condensing, which is factoring combined with immediate subsumption elimination when the factored clause subsumes the original clause. The clause '(or (P ?x) (P ?y)) gets factored, but not condensed. [Mark Stickel, personal communication, March, 2008]
Efficiency Rules

**Tautology Elimination:** If clause $C$ contains literals $L$ and $\neg L$, delete $C$ from the set of clauses. (Check throughout.)

**Pure-Literal Elimination:** If clause $C$ contains a literal $A$ ($\neg A$) and no clause contains a literal $\neg B$ ($B$) such that $A$ and $B$ are unifiable, delete $C$ from the set of clauses. (Check throughout.)

**Subsumption Elimination:** If the set of clauses contains clauses $C_1$ and $C_2$ such that there is a substitution $\sigma$ for which $C_1 \sigma \subseteq C_2$, delete $C_2$ from the set of clauses. (Check throughout.)

These rules delete unhelpful clauses.

Subsumption may be required to cut infinite loops.
Subsumption Cutting a Loop

prover(22): (prove '((if (and (ancestor ?x ?y)

Unit Preference: Resolve shorter clauses before longer clauses.

Least Symbol Count Version: Count symbols, not literals.

Set of Support: One clause in each pair being resolved must descend from the query.

Many others

These are heuristics for finding {} faster.
Least Symbol Count Version of Unit Preference

Instead of counting literals, count symbols ignoring negation operator.

Equivalent to standard unit preference for Propositional Logic.
Problem with Literal-Counting Unit Preference

Page 305
4.4 Translating Standard FOL Wffs into FOL Clause Form

Useful Meta-Theorems

- If $A$ is (an occurrence of) a subformula of $B$, and $\models A \iff C$, then $\models B \iff B\{C/A\}$

- $\forall x_1(\cdots \forall x_n(\cdots \exists y A(x_1, \ldots, x_n, y) \cdots) \cdots)$ is consistent if and only if $\forall x_1(\cdots \forall x_n(\cdots A(x_1, \ldots, x_n, f^n(x_1, \ldots, x_n)) \cdots) \cdots)$ is consistent, where $f^n$ is a new Skolem function.

Note: use a new Skolem constant instead of $f^0()$. 

Page 306
Translating Standard FOL Wffs into FOL Clause Form

Step 1

Eliminate occurrences of ↔ using

\[ \models (A \leftrightarrow B) \leftrightarrow ((A \Rightarrow B) \land (B \Rightarrow A)) \]

From:
\[ \forall x [\text{Parent}(x) \leftrightarrow (\text{Person}(x) \land \exists y (\text{Person}(y) \land \text{childOf}(y, x)))] \]

To:
\[ \forall x [(\text{Parent}(x) \Rightarrow (\text{Person}(x) \land \exists y (\text{Person}(y) \land \text{childOf}(y, x)))) \land ((\text{Person}(x) \land \exists y (\text{Person}(y) \land \text{childOf}(y, x))) \Rightarrow \text{Parent}(x))] \]
Translation Step 2

Eliminate occurrences of $\Rightarrow$ using

$$\models (A \Rightarrow B) \iff (\neg A \lor B)$$

From:

$$\forall x[(\text{Parent}(x) \Rightarrow (\text{Person}(x) \land \exists y(\text{Person}(y) \land \text{childOf}(y, x))))$$

$$\land ((\text{Person}(x) \land \exists y(\text{Person}(y) \land \text{childOf}(y, x))) \Rightarrow \text{Parent}(x))]$$

To:

$$\forall x[(\neg \text{Parent}(x) \lor (\text{Person}(x) \land \exists y(\text{Person}(y) \land \text{childOf}(y, x))))$$

$$\land (\neg (\text{Person}(x) \land \exists y(\text{Person}(y) \land \text{childOf}(y, x))) \lor \text{Parent}(x))]$$

Page 308
Translation Step 3

Translate to \textit{miniscope} form using

\[\models \neg
\neg A \iff A\]
\[\models \neg (A \land B) \iff (\neg A \lor \neg B) \quad \models \neg (A \lor B) \iff (\neg A \land \neg B)\]
\[\models \neg \forall x A(x) \iff \exists x \neg A(x) \quad \models \neg \exists x A(x) \iff \forall x \neg A(x)\]

From:
\[
\forall x[(\neg \text{Parent}(x) \lor (\text{Person}(x) \land \exists y (\text{Person}(y) \land \text{childOf}(y, x)))))
\land (\neg (\text{Person}(x) \land \exists y (\text{Person}(y) \land \text{childOf}(y, x))) \lor \text{Parent}(x))]
\]

To:
\[
\forall x[(\neg \text{Parent}(x) \lor (\text{Person}(x) \land \exists y (\text{Person}(y) \land \text{childOf}(y, x)))))
\land ((\neg \text{Person}(x) \lor \forall y (\neg \text{Person}(y) \lor \neg \text{childOf}(y, x))) \lor \text{Parent}(x))]
\]
Translation Step 4

Rename apart: If any two quantifiers bind the same variable, rename all occurrences of one of them.

From:
\[ \forall x[(\neg Parent(x) \lor (Person(x) \land \exists y(Person(y) \land childOf(y, x)))) \land ((\neg Person(x) \lor \forall y(\neg Person(y) \lor \neg childOf(y, x))) \lor Parent(x))] \]

To:
\[ \forall x[(\neg Parent(x) \lor (Person(x) \land \exists y(Person(y) \land childOf(y, x)))) \land ((\neg Person(x) \lor \forall z(\neg Person(z) \lor \neg childOf(z, x))) \lor Parent(x))] \]
Optional Translation Step 4.5

Translate into Prenex Normal Form using:

\[ (A \land \forall x B(x)) \iff \forall x (A \land B(x)) \]
\[ (A \lor \forall x B(x)) \iff \forall x (A \lor B(x)) \]
\[ (A \land \exists x B(x)) \iff \exists x (A \land B(x)) \]
\[ (A \lor \exists x B(x)) \iff \exists x (A \lor B(x)) \]

as long as \( x \) does not occur free in \( A \).

From:
\[
\forall x [\neg Parent(x) \lor (Person(x) \land \exists y (Person(y) \land childOf(y, x))) \land ((\neg Person(x) \lor \forall z (\neg Person(z) \lor \neg childOf(z, x))) \lor Parent(x))] 
\]

To:
\[
\forall x \exists y \forall z [\neg Parent(x) \lor (Person(x) \land (Person(y) \land childOf(y, x))) \land ((\neg Person(x) \lor (\neg Person(z) \lor \neg childOf(z, x))) \lor Parent(x))] 
\]
Translation Step 5

Skolemize

From:
\[ \forall x[\neg Parent(x) \lor (Person(x) \land \exists y(Person(y) \land childOf(y,x)))] \]
\[ \land \neg Person(x) \lor \forall z(-Parent(z) \lor \neg childOf(z,x)) \lor Parent(x)] \]

To:
\[ \forall x[\neg Parent(x) \lor (Person(x) \land (Person(f(x)) \land childOf(f(x),x)))] \]
\[ \land ((\neg Person(x) \lor \forall z(-Parent(z) \lor \neg childOf(z,x))) \lor Parent(x)] \]

or

From:
\[ \forall x\exists y\forall z[\neg Parent(x) \lor (Person(x) \land (Person(y) \land childOf(y,x)))] \]
\[ \land ((\neg Person(x) \lor (\neg Parent(z) \lor \neg childOf(z,x))) \lor Parent(x)] \]

To:
\[ \forall x\forall z[\neg Parent(x) \lor (Person(x) \land (Person(f(x)) \land childOf(f(x),x)))] \]
\[ \land ((\neg Person(x) \lor (\neg Parent(z) \lor \neg childOf(z,x))) \lor Parent(x)] \]
Translation Step 6

Discard all occurrences of “∀x” for any variable x.

From:
∀x[¬Parent(x) ∨ (Person(x) ∧ (Person(f(x)) ∧ \text{childOf}(f(x), x)))]
∧((¬Person(x) ∨ ∀z(¬Person(z) ∨ ¬\text{childOf}(z, x))) ∨ Parent(x))]

Or from:
∀x∀z[¬Parent(x) ∨ (Person(x) ∧ (Person(f(x)) ∧ \text{childOf}(f(x), x)))]
∧((¬Person(x) ∨ (¬Person(z) ∨ ¬\text{childOf}(z, x))) ∨ Parent(x))]

To:
[¬Parent(x) ∨ (Person(x) ∧ (Person(f(x)) ∧ \text{childOf}(f(x), x)))]
∧((¬Person(x) ∨ (¬Person(z) ∨ ¬\text{childOf}(z, x))) ∨ Parent(x))]

Page 313
Translation Step 7

CNF: Translate into Conjunctive Normal Form, using

\[ \models (A \lor (B \land C)) \iff ((A \lor B) \land (A \lor C)) \]
\[ \models ((B \land C) \lor A) \iff ((B \lor A) \land (C \lor A)) \]

From:

\[ [\neg \text{Parent}(x) \lor (\text{Person}(x) \land (\text{Person}(f(x)) \land \text{childOf}(f(x), x))) \land ((\neg \text{Person}(x) \lor (\neg \text{Person}(z) \lor \neg \text{childOf}(z, x))) \lor \text{Parent}(x))] \]

To:

\[ [((\neg \text{Parent}(x) \lor \text{Person}(x)) \land ((\neg \text{Parent}(x) \lor \text{Person}(f(x))) \land (\neg \text{Parent}(x) \lor \text{childOf}(f(x), x)))) \land ((\neg \text{Person}(x) \lor (\neg \text{Person}(z) \lor \neg \text{childOf}(z, x))) \lor \text{Parent}(x)))] \]
Translation Step 8

Discard extra parentheses using the associativity of $\land$ and $\lor$.

From:
$$[\neg Parent(x) \lor Person(x) \land (\neg Parent(x) \lor Person(f(x))) \land (\neg Parent(x) \lor \text{childOf}(f(x), x))) \land ((\neg Person(x) \lor (\neg Person(z) \lor \neg \text{childOf}(z, x))) \lor Parent(x))]$$

To:
$$[\neg Parent(x) \lor Person(x) \land (\neg Parent(x) \lor Person(f(x))) \land (\neg Parent(x) \lor \text{childOf}(f(x), x)) \land (\neg Person(x) \lor \neg Person(z) \lor \neg \text{childOf}(z, x) \lor Parent(x))]$$
Translation Step 9

Turn each disjunction into a clause,
and the conjunction into a set of clauses.

From:
\[
[(\neg Parent(x) \lor Person(x))
\land (\neg Parent(x) \lor Person(f(x)))
\land (\neg Parent(x) \lor childOf(f(x), x))
\land (\neg Person(x) \lor \neg Person(z) \lor \neg childOf(z, x) \lor Parent(x))]
\]
To:
\{
{\neg Parent(x), Person(x)},
{\neg Parent(x), Person(f(x))},
{\neg Parent(x), childOf(f(x), x)},
{\neg Person(x), \neg Person(z), \neg childOf(z, x), Parent(x)}\}
Translation Step 10

Rename the clauses apart
so that no variable occurs in more than one clause.

From:
\{
\{\neg Parent(x), Person(x)\},
\{\neg Parent(x), Person(f(x))\},
\{\neg Parent(x), childOf(f(x), x)\},
\{\neg Person(x), \neg Person(z), \neg childOf(z, x), Parent(x)\}\}

To:
\{
\{\neg Parent(x_1), Person(x_1)\},
\{\neg Parent(x_2), Person(f(x_2))\},
\{\neg Parent(x_3), childOf(f(x_3), x_3)\},
\{\neg Person(x_4), \neg Person(z_4), \neg childOf(z_4, x_4), Parent(x_4)\}\}
Use of Translation

\[ A_1, \ldots, A_n \models B \]

iff

The translation of \( A_1 \land \cdots \land A_n \land \neg B \) into a set of clauses is contradictory.

The Answer Predicate

Instead of query $\exists x_1 \cdots \exists x_n P(x_1, \ldots, x_n)$,
and resolution refutation with $\{\neg P(x_1, \ldots, x_n)\}$
until $\{\}$,
use $\forall x_1 \cdots \forall x_n (P(x_1, \ldots, x_n) \Rightarrow Answer(P(x_1, \ldots, x_n)))$
and do direct resolution with

$\{\neg P(x_1, \ldots, x_n), Answer(P(x_1, \ldots, x_n))\}$

until $\{(Answer \ldots) \cdots (Answer \ldots)\}$. 

Page 328
General Procedure for Inserting The Answer Predicate

Let:

$Q$ be either $∀$ or $∃$;

$\overline{Q}$ be either $∃$ or $∀$, respectively;

Prenex Normal form of query be $Q_1x_1 \cdots Q_nx_n P(x_1, \ldots, x_n)$.

Do direct resolution with clause form of

$\overline{Q_1x_1} \cdots \overline{Q_nx_n} (P(x_1, \ldots, x_n) \Rightarrow Answer(P(x_1, \ldots, x_n)))$

until generate $\{(Answer \ldots) \cdots (Answer \ldots)\}$.

Page 348
Interpretation of Clause
As Hypothetical Answer

25 ((Game Frisbee)
   (Answer (ProvidesScholarshipFor Buffalo ?36))
   (not (Athlete ?36)) (not (PlaysWell ?36 Frisbee)))

\neg Game(Frisbee) \Rightarrow \forall xy [\text{Athlete}(x) \land \text{PlaysWell}(x, \text{Frisbee})
\Rightarrow \text{ProvidesScholarshipFor}(\text{Buffalo}, x)]
Rule-Based Systems

Every FOL KB can be expressed as a set of rules of the form

\[ \forall x (C_1(x) \lor \cdots \lor C_m(x)) \]

or

\[ \forall x (A_1(x) \land \cdots \land A_n(x) \Rightarrow C_1(x) \lor \cdots \lor C_m(x)) \]

or

\[ \forall x (A_1(x) \land \cdots \land A_n(x) \Rightarrow C(x)) \]

where \( A_i(x) \) and \( C_j(x) \) are literals.
Wh Questions in Rule-Based Systems

Given rule $\forall x (A(x) \Rightarrow C(x))$

Ask $C(y)$?

Backchain to subgoal $A(x)\mu$, where $\mu$ is an mgu of $C(x))$ and $C(y))$

Moral: Unification is generally needed in backward chaining systems.

Unification is correct pattern matching when both structures have variables.
Forward Chaining & Unification

Forward chaining generally matches a ground fact with rule antecedents.

Forward chaining does not generally require unification.
Common Formalizing Difficulties

Every raven is black: $\forall x (Raven(x) \Rightarrow Black(x))$

Some raven is black: $\exists x (Raven(x) \land Black(x))$

Note the satisfying models of the incorrect
$\exists x (Raven(x) \Rightarrow Black(x))$
Another Formalizing Difficulty

Note where a Skolem function appears in
\[ \forall x(\text{Parent}(x) \Leftrightarrow \exists y \text{childOf}(y, x)) \]

\[ \Leftrightarrow \forall x((\text{Parent}(x) \Rightarrow \exists y \text{childOf}(y, x)) \]
\[ \quad \wedge ((\exists y \text{childOf}(y, x)) \Rightarrow \text{Parent}(x))) \]

\[ \Leftrightarrow \forall x((\neg \text{Parent}(x) \lor \exists y \text{childOf}(y, x)) \]
\[ \quad \wedge (\neg (\exists y \text{childOf}(y, x)) \lor \text{Parent}(x))) \]

\[ \Leftrightarrow \forall x((\neg \text{Parent}(x) \lor \exists y \text{childOf}(y, x)) \]
\[ \quad \wedge (\forall y(\neg \text{childOf}(y, x)) \lor \text{Parent}(x))) \]

\[ \Leftrightarrow \forall x(\text{Parent}(x) \Rightarrow \text{childOf}(f(x), x)) \]
\[ \quad \wedge \forall x \forall y(\text{childOf}(y, x) \Rightarrow \text{Parent}(x)) \]
What’s “First-Order” About FOL?

In a first-order logic:

Predicate and function symbols cannot be arguments of predicates or functions;

Variables cannot be in predicate or function position.

E.G. $\forall r [\text{Transitive}(r) \iff \forall xyz [r(x, y) \land r(y, z) \Rightarrow r(x, z)]]$

is not a first-order sentence.

“The adjective 'first-order' is used to distinguish the languages we shall study here from those in which there are predicates having other predicates or functions as arguments or in which predicate quantifiers or function quantifiers are permitted, or both.” [Elliott Mendelson, Introduction to Mathematical Logic, Fifth Edition, CRC Press, Boca Raton, FL, 2010, p. 48.]
Russell’s Theory of Types

Designed to solve paradox: \( \exists s \forall c [s(c) \iff \neg c(c)] \)

has instance \( S(S) \iff \neg S(S) \)
$N^{th}$-Order Logic

Assign type 0 to individuals and to terms denoting individuals. Assign type $i + 1$ to any set and to any function or predicate symbol that denotes a set, possibly of tuples, such that the maximum type of any of its elements is $i$.

Also assign type $i + 1$ to any variable that range over type $i$ objects.

Note that the type of a functional term is the type of its range—the $n^{th}$ element of the $n$-tuples of the set which the function denotes.

Syntactically, if the maximum type of the arguments of a ground atomic wff is $i$, then the type of the predicate is $i + 1$.

No predicate of type $i$ may take a ground argument of type $i$ or higher.
First-Order Logic Defined

First-order logic has a language that obeys Russell’s Theory of Types, and whose highest type symbol is of type 1.

$n^{th}$-order logic has a language that obeys Russell’s Theory of Types, and whose highest type symbol is of type $n$.

$\Omega$-ordered logic has no limit, but must still follow the rules.

E.g., $\forall r[\text{Transitive}(r) \iff \forall xyz[r(x, y) \land r(y, z) \Rightarrow r(x, z)]]$ is a formula of Second-Order Logic:

Type 0 objects: individuals in the domain
Type 1 symbols: $x, y, z$ because they range over type 0 objects
Type 1 objects: binary relations over type 0 objects
Type 2 symbols: $r$ because it ranges over type 1 objects,
$\text{Transitive}$ because it denotes a set of type 1 objects

Page 358
Nested Beliefs

Can a proposition be an argument of a proposition?

Consider:

\[\forall p (\text{Believes}(\text{Solomon}, p) \Rightarrow p)\]
\[\text{Believes}(\text{Solomon}, \text{Round}(\text{Earth})) \Rightarrow \text{Round}(\text{Earth})\]
\[\text{Believes}(\text{Solomon}, \text{Round}(\text{Earth}))\]
\[\models \text{Round}(\text{Earth})\]

If \(\text{Round}(\text{Earth})\) is an atomic wff, it’s not a term, and only terms may be arguments of functions and predicates.

Even if it could:

\[\llbracket \text{Round}(\text{Earth}) \rrbracket = \text{True} \text{ if } \llbracket \text{Earth} \rrbracket \in \llbracket \text{Round} \rrbracket, \text{ else False.}\]

So \(\llbracket \text{Believes}(\text{Solomon}, \text{Round}(\text{Earth})) \rrbracket = \text{True}\)

iff \(\langle \llbracket \text{Solomon} \rrbracket, \text{True-or-False} \rangle \in \llbracket \text{Believes} \rrbracket\)
Reifying Propositions
and the *Holds* Predicate

So how can we represent in FOL

“*Everything that Solomon believes is true*”?

- Reify (some) propositions.
  Make them objects in the domain.
  Represent them using individual constants or functional terms.

- Use *Holds*(*P*) to mean
  “*P holds (is true) in the given situation*”.

- Examples:

  \[
  \forall p(\text{Believes}(\text{Solomon}, p) \Rightarrow \text{Holds}(p))
  \]
  \[
  \text{Believes}(\text{Solomon}, \text{Round}(\text{Earth})) \Rightarrow \text{Holds}(\text{Round}(\text{Earth}))
  \]
Semantics of the \( \textit{Holds} \) Predicate

\[
\forall p (\text{Believes}(\text{Solomon}, p) \Rightarrow \text{Holds}(p)) \land \text{Believes}(\text{Solomon}, \text{Round}(\text{Earth})) \\
\Rightarrow \text{Holds}(\text{Round}(\text{Earth}))
\]

Type 0 individuals and terms:
\[\text{[Solomon]} = \text{[Solomon]} = \text{A person named Solomon}\]
\[\text{[Earth]} = \text{[Earth]} = \text{The planet Earth}\]
\[\text{[Round(Earth)]} = \text{[Round(Earth)]} = \text{The proposition that the Earth is round}\]

Type 1 objects and symbols:
\( p \): A variable ranging over type 0 propositions
\[\text{[Round]} = \text{A function from type 0 physical objects to type 0 propositions}.\]
\[\text{[Holds]} = \text{A set of type 0 propositions}.\]
\[\text{[Believes]} = \text{A set of pairs, type 0 People} \times \text{type 0 propositions}\]

Type 1 atomic formulas:
\[\text{[Holds(x)]} = \text{The type 1 proposition that [x] is True.}\]
\[\text{[Holds(x)]} = \text{True if [x] } \in \text{[Holds]; False otherwise}\]
\[\text{[Believes(x, y)]} = \text{The type 1 proposition that [x] believes [y]}\]
\[\text{[Believes(x, y)]} = \text{True if } \langle [x], [y] \rangle \in \text{[Believes]; False otherwise}\]
5 Summary of Part I

**Artificial Intelligence (AI):** A field of computer science and engineering concerned with the computational understanding of what is commonly called intelligent behavior, and with the creation of artifacts that exhibit such behavior.

**Knowledge Representation and Reasoning (KR or KRR):**
A subarea of Artificial Intelligence concerned with understanding, designing, and implementing ways of representing information in computers, and using that information to derive new information based on it.

KR is more concerned with belief than “knowledge”. Given that an agent (human or computer) has certain beliefs, what else is reasonable for it to believe, and how is it reasonable for it to act, regardless of whether those beliefs are true and justified.

Page 362
What is Logic?

Logic is the study of correct reasoning.

There are many systems of logic (logics). Each is specified by specifying:

- **Syntax**: Specifying what counts as a well-formed expression
- **Semantics**: Specifying the meaning of well-formed expressions
  - Intensional Semantics: Meaning relative to a Domain
  - Extensional Semantics: Meaning relative to a Situation
- **Proof Theory**: Defining proof/derivation, and how it can be extended.
Relevance of Logic

Any system that consists of

• a collection of symbol structures, well-formed relative to some syntax;

• a set of procedures for adding new structures to that collection based on what’s already in there.

is a logic.

But:
Do the symbol structures have a consistent semantics?
Are the procedures sound relative to that semantics?

Soundness is the essence of “correct reasoning.”
KR and Logic

Given that a Knowledge Base is represented in a language with a well-defined syntax, a well-defined semantics, and that reasoning over it is a well-defined procedure, a KR system is a logic.

KR research can be seen as a search for the best logic to capture human-level reasoning.
# Relations Among Inference Problems

</tr>
</tbody>
</table>

- (\downarrow \text{Soundness})
- (\uparrow \text{Completeness})
Inference/Reasoning Methods

Given a KB/set of assumptions $\mathcal{A}$ and a query $Q$:

- **Model Finding**
  - Direct: Find satisfying models of $\mathcal{A}$, see if $Q$ is True in all of them.
  - Refutation: Find if $\mathcal{A} \cup \{\neg Q\}$ is unsatisfiable.

- **Natural Deduction**
  - Direct: Find if $\mathcal{A} \vdash Q$.

- **Resolution**
  - Direct: Find if $\mathcal{A} \vdash Q$ (incomplete).
  - Refutation: Find if $\bigwedge \mathcal{A} \land \neg Q$ is inconsistent.
Classes of Logics

• Propositional Logic
  – Finite number of atomic propositions and models.
  – Model finding and resolution are decision procedures.

• Finite-Model Predicate Logic
  – Finite number of terms, atomic formulae, and models.
  – Reducible to propositional logic.
  – Model finding and resolution are decision procedures.

• First-Order Logic
  – Infinite number of terms, atomic formulae, and models.
  – Not reducible to propositional logic.
  – There are no decision procedures.
  – Resolution plus factoring is refutation complete.

Page 368
Logics We Studied

1. Standard Propositional Logic
2. Clause Form Propositional Logic
3. Standard Finite-Model Predicate Logic
4. Clause Form Finite-Model Predicate Logic
5. Standard First-Order Predicate Logic
6. Clause Form First-Order Predicate Logic
Proof Procedures We Studied

1. Direct model finding: truth tables, decreasoner, relsat (complete search) walksat, gsat (stochastic search)

2. Semantic tableaux (model-finding refutation)

3. Wang algorithm (model-finding refutation), wang

4. Hilbert-style axiomatic (direct), brief

5. Fitch-style natural deduction (direct)

6. Resolution (refutation), prover, SNARK
Utility Notions and Techniques

1. Material implication

2. Possible properties of connectives
   commutative, associative, idempotent

3. Possible properties of well-formed expressions
   free, bound variables
   open, closed, ground expressions

4. Possible semantic properties of wffs
   contradictory, satisfiable, contingent, valid

5. Possible properties of proof procedures
   sound, consistent, complete,
   decision procedure, semi-decision procedure
More Utility Notions and Techniques

5. Substitutions
   application, composition

6. Unification
   most general common instance (mgci),
   most general unifier (mgu)

7. Translation from standard form to clause form
   Conjunctive Normal Form (CNF),
   Skolem functions/constants

8. Resolution Strategies
   subsumption, unit preference, set of support

9. The Answer Literal
Unification

• Unification is a least-commitment method of choosing a substitution for Universal Instantiation ($\forall E$).

• Unification is correct pattern matching when both structures have variables.

• Unification is generally needed in backward chaining systems.

Page 374
6 Prolog

6.1 Horn Clauses .......................................................... 376
6.2 Prolog ................................................................. 379
6.1 Horn Clauses

A Horn Clause is a clause with at most one positive literal.

Either \{¬Q_1(\overline{x}), \ldots, ¬Q_n(\overline{x})\} (negative Horn clause)
or \{C(\overline{x})\} (fact or positive or definite Horn clause)
or \{¬A_1(\overline{x}), \ldots, ¬A_n(\overline{x}), C(\overline{x})\} (positive or definite Horn clause)
which is the same as

\[ A_1(\overline{x}) \land \cdots \land A_n(\overline{x}) \Rightarrow C(\overline{x}) \]

where \(A_i(\overline{x}), C(\overline{x}),\) and \(Q(\overline{x})\) are atoms.
SLD Resolution

Selected literals, Linear pattern, over Definite clauses

SLD derivation of clause $c$ from set of clauses $S$ is $c_1, \ldots, c_n = c$
s.t. $c_1 \in S$
and $c_{i+1}$ is resolvent of $c_i$ and a clause in $S$. [B&L, p. 87]

If $S$ is a set of Horn clauses, then there is a resolution derivation of $\{\}$ from $S$
iff there is an SLD derivation of $\{\}$ from $S$. 

Page 377
SLDSolve

procedure SLDSolve(KB,query) returns true or false {
/* KB = \{rule_1, ..., rule_n\}
* rule_i = \{h_i, \neg b_{i1}, ..., \neg b_{ik_i}\}
* query = \{\neg q_1, ..., \neg q_m\} */
if (m = 0) return true;
for i := 1 to n {
    if((\mu := Unify(q_1, h_i)) \neq FAIL
        and SLDSolve(KB, \{-b_{i1}\mu, ..., \neg b_{ik_i}\mu, \neg q_2\mu, ..., \neg q_m\mu\})) {
        return true;
    }
}
return false;
}

Where \(h_i, b_{ij},\) and \(q_i\) are atomic formulae.
See B\&L, p. 92

Avoid Left Recursive Rules

To define ancestor as the transitive closure of parent.

The base case: \textit{ancestor}(X,Y) :- \textit{parent}(X,Y).

Three possible recursive cases:

Versions (2) and (3) will cause infinite loops.
7 A Potpourri of Subdomains

7.1 Taxonomies ................................................................. 412
7.2 Time ................................................................. 418
7.3 Things vs. Substances .................................................. 425
Taxonomies: Categories as Intensional Sets

In mathematics, a set is defined by its members. This is an **extensional set**.

Plato: *Man is a featherless biped.*

An **intensional** set is defined by properties.

Aristotle: *Man is a rational animal.*

A category (type, class) is an intensional set.
Taxonomies: Need for Two Relations

With sets, there’s a difference between

set membership, \(\in\)

and subset, \(\subset, \subseteq\)

One difference is that subset is transitive:

\{1, 3, 5\} \subset \{1, 3, 5, 7, 9\} and \{1, 3, 5, 7, 9\} \subset \{1, 2, 3, 4, 5, 6, 7, 8, 9\}

and \{1, 3, 5\} \subset \{1, 2, 3, 4, 5, 6, 7, 8, 9\}

membership is not:

\(5 \in \{1, 3, 5, 7, 9\}\) and \{1, 3, 5, 7, 9\} \in \{\{1, 3, 5, 7, 9\}, \{2, 4, 6, 8\}\}

but \(5 \not\in \{\{1, 3, 5, 7, 9\}, \{2, 4, 6, 8\}\}\)

Similarly, we need both the instance relation and the subcategory relation.
Taxonomies:
Categories as Unary Predicates

One way to represent taxonomies:

\[ Canary(Tweety) \]
\[ \forall x[(Canary(x) \implies Bird(x))] \]
\[ \forall x[(Bird(x) \implies Vertebrate(x))] \]
\[ \forall x[(Vertebrate(x) \implies Chordate(x))] \]
\[ \forall x[(Chordate(x) \implies Animal(x))] \]
Taxonomies: Reifying

To reify: to make a thing of.
Allows discussion of “predicates” in FOL.

Membership: Member or Instance or Isa
Isa(Tweety, Canary)

Subcategory: Subclass or Ako (sometimes, even, Isa)
Ako(Canary, Bird)
Ako(Bird, Vertebrate)
Ako(Vertebrate, Chordate)
Ako(Chordate, Animal)

Axioms:
∀x∀c₁∀c₂[Isa(x, c₁) ∧ Ako(c₁, c₂) ⇒ Isa(x, c₂)]
∀c₁∀c₂∀c₃[Ako(c₁, c₂) ∧ Ako(c₂, c₃) ⇒ Ako(c₁, c₃)]
Discussing Categories

*Isa*(Canary, Species)

*Isa*(Bird, Class)

*Isa*(Chordate, Phylum)

*Isa*(Animal, Kingdom)

*Extinct*(Dinosaur)

Note: That’s *Isa*, not *Ako*.

If categories are predicates, requires second-order logic.

Other relationships: exhaustive subcategories, disjoint categories, partitions.

DAG (directed acyclic graph), rather than just a tree.

E.g., human: man vs. woman; child vs. adult vs. senior.

Page 416
Transitive Closure

It’s sometimes useful (especially in Prolog) to have a second relation, \( R_2 \) be the transitive closure of a relation, \( R_1 \).

\[
\forall R_1, R_2 [\text{transitiveClosureOf}(R_2, R_1) \\
\Leftrightarrow [\forall x, y (R_1(x, y) \Rightarrow R_2(x, y)) \\
\quad \land \forall x, y, z [R_1(x, y) \land R_2(y, z) \Rightarrow R_2(x, z)]]
\]

E.g. \( \text{ancestor} \) is the transitive closure of \( \text{parent} \):

\[
\forall x, y [\text{parent}(x, y) \Rightarrow \text{ancestor}(x, y)]
\]

\[
\forall x, y, z [\text{parent}(x, y) \land \text{ancestor}(y, z) \Rightarrow \text{ancestor}(x, z)]
\]
7.2 Time

How would you represent time?

Discuss
Subjective vs. Objective: Subjective

Make now an individual in the domain.
Include other times relative to now.
OK if time doesn’t move.
Subjective vs. Objective: Objective

Make \texttt{now} a meta-logical variable with some time-denoting term as value.

Relate times to each other, \textit{e.g.} $\textit{Before}(t1, t2)$.

Now can move by giving \texttt{now} a new value.
Points vs. Intervals: Points

Use numbers: integers, rationals, reals?

Computer reals aren’t really dense.

How to assign numbers to times?

Granularity: How big, numerically, is a day, or any other interval of time?

If an interval is defined as a pair of points, which interval is the midpoint in, if one interval immediately follows another?
Points vs. Intervals: Intervals

Use intervals only: no points at all.

More cognitively accurate.

Granularity is not fixed.

A “point” is just an interval with nothing inside it.
James Allen’s Interval Relations

\[
\begin{array}{ccc}
\text{x} & \text{before}(x,y) & \text{meets}(x,y) \\
\text{y} & \text{meets}(x,y) & \text{equals}(x,y) \\
\text{x} & \text{equals}(x,y) & \text{starts}(x,y) \\
\text{y} & \text{starts}(x,y) & \text{finishes}(x,y) \\
\text{x} & \text{finishes}(x,y) & \text{during}(x,y) \\
\text{y} & \text{during}(x,y) & \\
\end{array}
\]

A Smaller Set of Temporal Relations

If fewer distinctions are needed, one may use

\( \text{before}(x, y) \) for Allen’s \( \text{before}(x, y) \lor \text{meets}(x, y) \)

\( \text{during}(x, y) \) for Allen’s \( \text{starts}(x, y) \lor \text{during}(x, y) \lor \text{finishes}(x, y) \)

\( \text{overlaps}(x, y) \) and \( \text{equals}(x, y) \)

and appropriate converses.
7.3 Things vs. Substances
Count Nouns vs. Mass Nouns

A count noun denotes a thing.
Count nouns can be singular or plural.
Things can be counted.
One dog. Two dogs.

A mass noun denotes a substance.
Mass nouns can only be singular.
One can have a quantity of a substance.
A glass of water. A pint of ice cream.
A Quantity of a Substance is a Thing

*water* a substance

*a lake = a body of water* a thing

*lakes* a plurality of things

*40 acres of lakes* a quantity of a substance
Nouns with mass and count senses

A noun might have both senses.

*a piece of pie* vs. *A piece of a pie*

two *pieces of steak* vs. *two steaks*

Any count noun can be “massified”.

Any thing can be put through “the universal grinder”.

*I can’t get up; I’ve got cat on my lap.*

8.1 SNePSLOG Semantics ........................................... 429
8.2 SNePSLOG Syntax ................................................... 433
8.3 SNePSLOG Proof Theory ........................................... 446
8.4 Loading and Running SNePSLOG ............................... 456
8.5 Reasoning Heuristics .............................................. 467
8.6 SNePS as a Network ................................................. 489
8.7 SNeRE: The SNePS Rational Engine ......................... 499
8.1 SNePSLOG Semantics
The Intensional Domain of (Mental) Entities

Frege: The Morning Star is the Evening Star.
different from The Morning Star is the Morning Star.

Russell: George IV wanted to know whether Scott was the author of Waverly.
not George IV wanted to know whether the author of Waverly was the author of Waverly.

Jerry Siegel and Joe Shuster: Clark Kent is a mild-mannered reporter; Superman is the man of steel.
Intensions vs. Extensions

the Morning Star and the Evening Star
Scott and the author of Waverly
Clark Kent and Superman

are different intensions, or intensional entities, or mental entities, or just entities,
even though they are coreferential, or extensionally equivalent, or have the same extensions.
SNePSLOG Semantics
Intensional Representation

SNePSLOG individual ground terms denote intensions, (mental) entities.

Mental entities include propositions.

Propositions are first-class members of the domain.

SNePSLOG wffs denote propositions.

Assume that for every entity in the domain there is a term that denotes it.

Make unique names assumption: no two terms denote the same entity.
The Knowledge Base

Think of the SNePS KB as the contents of the mind of an intelligent agent.

The terms in the KB denote mental entities that the agent has conceived of (so far).

Some of the wffs are asserted.
These denote propositions that the agent believes.

The rules of inference sanction believing some additional proposition(s), but drawing that inference is optional.
I.e., the agent is not logically omniscient.
8.2 SNePSLOG Syntax
Atomic Symbols

Individual Constants, Variables, Function Symbols:
any Lisp symbol, number, or string.
All that matters is the sequence of characters.
I.e. "4", \4, and 4, are the same.
The sets of individual constants, variables, and function symbols
should be distinct, but don’t have to be.
SNePSLOG Syntax

Terms

An individual constant is a term.

A variable is a term.

If \( t_1, \ldots, t_n \) are terms, then \( \{t_1, \ldots, t_n\} \) is a set of terms.

If \( f \) is a function symbol or a variable, then \( f() \) is a term.

If \( t_1, \ldots, t_n \) are terms or sets of terms and \( f \) is a function symbol or variable, then \( f(t_1, \ldots, t_n) \) is a term.

A function symbol needn’t have a fixed arity, but it might be a mistake of formalization otherwise.
SNePSLOG Syntax

Atomic Wffs

If $x$ is a variable, then $x$ is a wff.

If $P$ is a proposition-valued function symbol or variable, then $P()$ is a wff.

If $t_1, \ldots, t_n$ are terms or sets of terms and $P$ is a proposition-valued function symbol or variable, then $P(t_1, \ldots, t_n)$ is a wff.

A predicate symbol needn’t have a fixed arity, but it might be a mistake of formalization otherwise.

If $P_1, \ldots, P_n$ are wffs, then $\{P_1, \ldots, P_n\}$ is a set of wffs.

Abbreviation: If $P$ is a wff, then $P$ is an abbreviation of $\{P\}$.

Every wff is a proposition-denoting term.
If \{P_1, \ldots, P_n\} is a set of wffs (proposition-denoting terms), and \(i\) and \(j\) are integers such that \(0 \leq i \leq j \leq n\), then 
\[
\text{andor}(i, j)\{P_1, \ldots, P_n\}
\]
is a wff (proposition-denoting term).
The proposition that at least \(i\) and at most \(j\) of \(P_1, \ldots, P_n\) are True.
SNePSLOG Syntax/Semantics

Abbreviations of AndOr

\[ \sim P = \text{andor}(0,0)\{P\} \]

\[ \text{and}\{P_1, \ldots, P_n\} = \text{andor}(n,n)\{P_1, \ldots, P_n\} \]

\[ \text{or}\{P_1, \ldots, P_n\} = \text{andor}(1,n)\{P_1, \ldots, P_n\} \]

\[ \text{nand}\{P_1, \ldots, P_n\} = \text{andor}(0,n-1)\{P_1, \ldots, P_n\} \]

\[ \text{nor}\{P_1, \ldots, P_n\} = \text{andor}(0,0)\{P_1, \ldots, P_n\} \]

\[ \text{xor}\{P_1, \ldots, P_n\} = \text{andor}(1,1)\{P_1, \ldots, P_n\} \]

\[ P_1 \text{ and } \ldots \text{ and } P_n = \text{andor}(n,n)\{P_1, \ldots, P_n\} \]

\[ P_1 \text{ or } \ldots \text{ or } P_n = \text{andor}(1,n)\{P_1, \ldots, P_n\} \]
SNePSLOG Syntax/Semantics
Thresh

If \( \{P_1, \ldots, P_n\} \) is a set of wffs (proposition-denoting terms) and \( i \) and \( j \) are integers such that \( 0 \leq i \leq j \leq n \), then
\[
\text{thresh}(i, j)\{P_1, \ldots, P_n\}
\]
is a wff (proposition-denoting term).

The proposition that
either fewer than \( i \) or more than \( j \) of \( P_1, \ldots, P_n \) are True.
iff\{P_1, \ldots, P_n\}
is an abbreviation of \text{thresh}(1, n - 1)\{P_1, \ldots, P_n\}

P_1 \iff \cdots \iff P_n
is an abbreviation of \text{thresh}(1, n - 1)\{P_1, \ldots, P_n\}

\text{thresh}(i)\{P_1, \ldots, P_n\}
is an abbreviation of \text{thresh}(i, n - 1)\{P_1, \ldots, P_n\}
If \( \{P_1, \ldots, P_n\} \) and \( \{Q_1, \ldots, Q_m\} \) are sets of wffs (proposition-denoting terms), and \( i \) is an integer, \( 1 \leq i \leq n \), then
\[
\{P_1, \ldots, P_n\} \ i\Rightarrow \ {Q_1, \ldots, Q_m} \text{ is a wff (proposition-denoting term).}
\]

The proposition that whenever at least \( i \) of \( P_1, \ldots, P_n \) are True, then so is any \( Q_j \in \{Q_1, \ldots, Q_m\} \).
SNePSLOG Syntax/Semantics
Abbreviations of Numerical Entailment

\[{P_1, \ldots, P_n} \Rightarrow {Q_1, \ldots, Q_m}\]
is an abbreviation of \[\{P_1, \ldots, P_n\} \ 1\Rightarrow \ \{Q_1, \ldots, Q_m\}\]

\[{P_1, \ldots, P_n} \ \lor\Rightarrow \ \{Q_1, \ldots, Q_m\}\]
is also an abbreviation of \[\{P_1, \ldots, P_n\} \ 1\Rightarrow \ \{Q_1, \ldots, Q_m\}\]

\[{P_1, \ldots, P_n} \ \&\Rightarrow \ \{Q_1, \ldots, Q_m\}\]
is an abbreviation of \[\{P_1, \ldots, P_n\} \ n\Rightarrow \ \{Q_1, \ldots, Q_m\}\]
If $P$ is a wff (proposition-denoting term) and $x_1, \ldots, x_n$ are variables, then

$\text{all}(x_1, \ldots, x_n)(P)$ is a wff (proposition-denoting term).

The proposition that for every sequence of ground terms, $t_1, \ldots, t_n$, $P\{t_1/x_1, \ldots, t_n/x_n\}$ is True.
If $\mathcal{P}$ and $\mathcal{Q}$ are sets of wffs, $x_1, \ldots, x_n$ are variables, and $i$, $j$, and $k$ are integers such that $0 \leq i \leq j \leq k$, then

$$\text{nexists}(i, j, k)(x_1, \ldots, x_n)(\mathcal{P} : \mathcal{Q})$$

is a wff.

The proposition that there are $k$ sequences of ground terms, $t_1, \ldots, t_n$, that satisfy every $P \in \mathcal{P}$, and, of them, at least $i$ and at most $j$ also satisfy every $Q \in \mathcal{Q}$.
SNePSLOG Syntax/Semantics
Abbreviations of Numerical Quantifier

nexi\nexists(_, j, _)(x_1, \ldots, x_n)(\mathcal{P}: \mathcal{Q})

is an abbreviation of nexi\nexists(0, j, \infty)(x_1, \ldots, x_n)(\mathcal{P}: \mathcal{Q})

nexi\nexists(i, _, k)(x_1, \ldots, x_n)(\mathcal{P}: \mathcal{Q})

is an abbreviation of nexi\nexists(i, k, k)(x_1, \ldots, x_n)(\mathcal{P}: \mathcal{Q})
SNePSLOG Syntax/Semantics

Wffs are Terms

Every wff is a proposition-denoting term.

So, e.g., Believes(Tom, ~Penguin(Tweety))
is a wff, and a well-formed term.

For a more complete, more formal syntax, see
The SNePS 2.7.1 User’s Manual,
8.3 SNePSLOG Proof Theory
Implemented Rules of Inference

Reduction Inference\(_1\): If \(\alpha\) is a set of terms and \(\beta \subset \alpha\),
\[ P(t_1, \ldots, \alpha, \ldots t_n) \vdash P(t_1, \ldots, \beta, \ldots, t_n) \]

Reduction Inference\(_2\): If \(\alpha\) is a set of terms, and \(t \in \alpha\),
\[ P(t_1, \ldots, \alpha, \ldots t_n) \vdash P(t_1, \ldots, t, \ldots t_n) \]

   (named (patSchedule default-defaultct)) (kinconsistent nil))

: time(facultyMeeting,?t)?

A contradiction was detected within context patSchedule.
The contradiction involves the newly derived proposition:
  wff8!: time(facultyMeeting,morning)

and the previously existing proposition:
  wff9!: ¬time(facultyMeeting,morning)

You have the following options:
1. [C]ontinue anyway, knowing that a contradiction is derivable;
2. [R]e-start the exact same run in a different context which is
   not inconsistent;
3. [D]rop the run altogether.

Note the absence of Location(belowGround)
Moral

If retain derived beliefs (lemmas),
need a way to delete them
when their foundations are removed.
If the KB contains beliefs about the (some) world, and the world changes, and the KB does not have a model of time. I.e. the beliefs in the KB are of the form, I believe this is true now.
What’s needed

Links from hypotheses to propositions derived from them.

  wff39!: ~OnFloor(1)
  wff37!: ~OnFloor(2)
  wff36!: ~OnFloor(3)
  wff31!: wheneverdo(OnFloor(4),believe(HaveBeenOnFloor(4)))
  wff29!: HaveBeenOnFloor(4)
  wff27!: wheneverdo(OnFloor(3),believe(HaveBeenOnFloor(3)))
  wff23!: wheneverdo(OnFloor(2),believe(HaveBeenOnFloor(2)))
  wff19!: wheneverdo(OnFloor(1),believe(HaveBeenOnFloor(1)))
  wff17!: HaveBeenOnFloor(1)
  wff16!: Floor(1)
  wff15!: Floor(2)
  wff14!: Floor(3)
  wff13!: Floor(4)
  wff10!: {OnFloor(4),OnFloor(3)} v=> {Location(aboveGround)}
  wff9!: Location(aboveGround)
  wff8!: {OnFloor(2),OnFloor(1)} v=> {Location(belowGround)}
  wff6!: xor{OnFloor(4),OnFloor(3),OnFloor(2),OnFloor(1)}
  wff5!: OnFloor(4)
  wff1!: Floor({4,3,2,1})

HaveBeenOnFloor(1) remains; OnFloor(1) doesn’t.
Moral

The consequents of
=>, v=>, &=>, or, nand, xor, iff, andor, thresh, and nexists
are derived and retain a connection to their underlying hypotheses.

Whatever is believe’d is a hypothesis.

Use =>, v=>, &=>, or, nand, xor, iff, andor, thresh, and nexists
for logical implications.

Use whendo(p1,believe(p2)) or wheneverdo(p1,believe(p2))
for decisions.
Contingent Plans

: xor{Location(BellHall), Location(home)}.

: Location(BellHall) => ActPlan(getMail, go(MailRoom)).

: Location(home) => ActPlan(getMail, go(mailBox)).

: perform believe(Location(BellHall))

: ActPlan(getMail, ?how)?

  wff5!: ActPlan(getMail, go(MailRoom))

: perform believe(Location(home))

: ActPlan(getMail, ?how)?

  wff8!: ActPlan(getMail, go(mailBox))
Using this design for contingent plans, along with retention of lemmas, depends on belief revision.
Motivation

Sea Creatures

: all(x)(andor(0,1){Ako(x, mammal), Ako(x, fish)}).

: all(x)(LiveIn(x, water) => Ako(x, fish)).

: all(x)(BearYoung(x, live) => Ako(x, mammal)).

: LiveIn(whales, water).
: LiveIn(sharks, water).

: BearYoung(whales, live).
: BearYoung(dogs, live).
Motivation
Are Whales Fish or Mammals?

: Ako(whales, ?x)?

A contradiction was detected within context default-defaultct
The contradiction involves the newly derived proposition:
  wff8!: Ako(whales,mammal)

and the previously existing proposition:
  wff9!: ~Ako(whales,mammal)
SNeBR Options

You have the following options:

1. [C]ontinue anyway, knowing that a contradiction is derivable;
2. [R]e-start the exact same run in a different context which is not inconsistent;
3. [D]rop the run altogether.

(please type c, r or d)

=><= r

In order to make the context consistent you must delete at least one hypothesis from each of the following sets of hypotheses:

(wff6 wff4 wff3 wff2 wff1)
Possible Culprits

In order to make the context consistent you must delete at least one hypothesis from the set listed below.

An inconsistent set of hypotheses:

1: \( \text{wff6!}!: \text{BearYoung}(\text{whales, live}) \)
   \(\text{(2 supported propositions: (wff8 wff6) )}\)

2: \( \text{wff4!}!: \text{LiveIn}(\text{whales, water}) \)
   \(\text{(3 supported propositions: (wff10 wff9 wff4) )}\)

3: \( \text{wff3!}!: \text{all}(x)(\text{BearYoung}(x, \text{live}) \Rightarrow \text{Ako}(x, \text{mammal})) \)
   \(\text{(2 supported propositions: (wff8 wff3) )}\)

4: \( \text{wff2!}!: \text{all}(x)(\text{LiveIn}(x, \text{water}) \Rightarrow \text{Ako}(x, \text{fish})) \)
   \(\text{(3 supported propositions: (wff10 wff9 wff2) )}\)

5: \( \text{wff1!}!: \text{all}(x)(\text{nand}\{\text{Ako}(x, \text{fish}), \text{Ako}(x, \text{mammal})\}) \)
   \(\text{(2 supported propositions: (wff9 wff1) )}\)
Choosing the Culprit

Enter the list number of a hypothesis to examine or 
[d] to discard some hypothesis from this list,  
[a] to see ALL the hypotheses in the full context,  
[r] to see what you have already removed,  
[q] to quit revising this set, or  
[i] for instructions

(please type a number OR d, a, r, q or i)

=><= d

Enter the list number of a hypothesis to discard,  
[c] to cancel this discard, or [q] to quit revising this set.

=><= 4

Page 531
Remaining Possible Culprits

The consistent set of hypotheses:

1 : \text{wff6!: } \text{BearYoung(whales, live)}
   
   (2 supported propositions: \text{(wff8 wff6) )}

2 : \text{wff4!: } \text{LiveIn(whales, water)}
   
   (1 supported proposition: \text{(wff4) )}

3 : \text{wff3!: } \forall x (\text{BearYoung(x, live) } \rightarrow \text{Ako(x, mammal)})
   
   (2 supported propositions: \text{(wff8 wff3) )}

4 : \text{wff1!: } \forall x (\text{nand\{Ako(x, fish), Ako(x, mammal)\}})
   
   (1 supported proposition: \text{(wff1) )}

Enter the list number of a hypothesis to examine or
[d] to discard some hypothesis from this list,
[a] to see ALL the hypotheses in the full context,
[r] to see what you have already removed,
[q] to quit revising this set, or
[i] for instructions
(please type a number OR d, a, r, q or i)

=><= q

Page 532
Other Hypotheses

The following (not known to be inconsistent) set of hypotheses was also part of the context where the contradiction was derived:

\( (\text{wff7 \ wff5}) \)

Do you want to inspect or discard some of them?  
\( \Rightarrow \leq \) no

Do you want to add a new hypothesis?  no

\( \text{wff11!}: \sim \text{Ako(whales,fish)} \)
\( \text{wff8!}: \text{Ako(whales,mammal)} \)

CPU time : 0.03
Resultant KB

: list-asserted-wffs
  wff12!: ~(all(x)(LiveIn(x,water) => Ako(x,fish)))
  wff11!: ~Ako(whales,fish)
  wff8!: Ako(whales,mammal)
  wff7!: BearYoung(dogs,live)
  wff6!: BearYoung(whales,live)
  wff5!: LiveIn(shakes,water)
  wff4!: LiveIn(whales,water)
  wff3!: all(x)(BearYoung(x,live) => Ako(x,mammal))
  wff1!: all(x)(nand{Ako(x,fish),Ako(x,mammal}})
Moral
When Needed 2

If accepting information from multiple sources,
or just one possibly inconsistent source,
need a way to recognize contradictions,
and to find the culprit,
and to delete it,
and its implications.
What’s Needed

Links between derived propositions
and hypotheses they were derived from.
9.2 Relevance Logic (R)

Motivation

Paradoxes of Implication 1

Anything Implies a Truth

\[
\begin{array}{c|c|c}
1 & A & \text{Hyp} \\
2 & B & \text{Hyp} \\
3 & A & \text{Reit, 1} \\
4 & B \Rightarrow A & \Rightarrow \text{I, 2–3} \\
5 & A \Rightarrow (B \Rightarrow A) & \Rightarrow \text{I, 1–4} \\
\end{array}
\]

But it seems that \( B \) had nothing to do with deriving \( A \).
Motivation of R

Paradoxes of Implication 2

A Contradiction Implies Anything

1 \( A \land \neg A \) Hyp
2 \( \neg B \) Hyp
3 \( A \land \neg A \) Reit, 1
4 \( A \) \( \land E \), 3
5 \( \neg A \) \( \land E \), 3
6 \( B \) \( \neg I \), 2–5
7 \( (A \land \neg A) \Rightarrow B \) \( \Rightarrow I \), 1–6

But it seems that \( \neg B \) had nothing to do with deriving the contradiction.

Page 538
What’s Needed

A way to determine when a hypothesis is really used to derive another wff.

When a hypothesis is relevant to a conclusion.
9.3 R
Relevance Logic
The Logic of Relevant Implication

Syntax: The same as Standard FOL.

Intensional Semantics: The same as Standard FOL.

Extensional Semantics: The same as Standard FOL for terms.
For wffs: a four-valued logic, using True, False, Neither, and Both.
KB Interpretations of R’s 4 Truth Values

True       true
False      false
Neither    unknown
Both       contradictory, “I’ve been told both.”

or a “true contradiction”

such as Russell’s set both is and isn’t a member of itself.
9.4 R Proof Theory
Structural Rules of Inference

\[ i. \quad A, \{n\} \quad Hyp \]

\[ i. \quad A, \alpha \]

\[ \vdots \]

\[ \vdots \]

\[ j. \quad A, \alpha \quad Rep, i \]

\[ j. \quad A, \alpha \quad Reit, i \]

where \( n \) is a new integer.
R Rules for $\Rightarrow$

\begin{align*}
\text{i.} & \quad A, \{n\} \quad \text{Hyp} \quad \text{i.} & \quad A, \alpha \\
\text{j.} & \quad B, \alpha, \text{ s.t. } n \in \alpha \quad \text{j.} & \quad (A \Rightarrow B), \beta \\
\text{k.} & \quad (A \Rightarrow B), \alpha - \{n\} \quad \Rightarrow I, i-j \quad \text{k.} & \quad B, \alpha \cup \beta \quad \Rightarrow E, i, j
\end{align*}
How the Paradoxes of Implication are Blocked 1

1. \( A, \{1\} \quad Hyp \)

2. \( B, \{2\} \quad Hyp \)

3. \( A, \{1\} \quad Reit, 1 \)

Can’t then apply \( \Rightarrow I \)
R Rules for $\land$

\begin{align*}
\text{i}_1. \quad & A_1, \alpha \\
\vdots \quad & \\
\text{i}_n. \quad & A_n, \alpha \\
\text{j.} \quad & A_1 \land \cdots \land A_n, \alpha \land I, i_1, \ldots, i_n \\
\text{i.} \quad & A_1 \land \cdots \land A_n, \alpha \\
\vdots \quad & \\
\text{j.} \quad & A_k, \alpha \land E, i
\end{align*}
Why $\land I$ Requires the Same OS

If Not

1. $A, \{1\}$  Hyp, 2–5
2. $B, \{2\}$  Hyp, 3–5
3. $A, \{1\}$  Reit, 1
4. $(A \land B), \{1, 2\}$  $\land I$?
5. $A, \{1, 2\}$  $\land E$, 4
6. $(B \Rightarrow A), \{1\}$  $\Rightarrow I$, 2–5
7. $(A \Rightarrow (B \Rightarrow A)), \{}$  $\Rightarrow I$, 1–6

Reconstruct paradox of implication.

Note: Empty os means a theorem.
Extended Rule for $\land I$

\[
i_1. \quad A_1, \alpha \\
\vdots \\
i_n. \quad A_n, \eta \\
j. \quad A_1 \land \cdots \land A_n, (\alpha \cup \cdots \cup \eta)^* \quad \land I, i_1, \ldots, i_n
\]

Can’t apply $\land E$ to an extended wff.
### R Rules for $\neg$

<table>
<thead>
<tr>
<th>i.</th>
<th>$A, {n}$</th>
<th>Hyp</th>
<th>j.</th>
<th>$\neg A, {n}$</th>
<th>Hyp</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>$B, \alpha$ s.t. $n \in \alpha$</td>
<td>$\neg B, \alpha$</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>$\neg A, \alpha - {n}$</td>
<td>$\neg I, i - (j + 1)$</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>$-\neg A, \alpha$</td>
<td>$\neg I, i - (j + 1)$</td>
</tr>
</tbody>
</table>

| i. | $\neg A, \alpha$ |
| j. | $A, \alpha$ | $\neg E, i$ |

Page 548
### Extended R Rule for $-I$

<table>
<thead>
<tr>
<th></th>
<th>( A, {n} )</th>
<th>( HYP )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( i \cdot )</td>
<td>( \vdots )</td>
<td>( \vdots )</td>
</tr>
<tr>
<td>( j \cdot )</td>
<td>( B, \alpha )</td>
<td></td>
</tr>
<tr>
<td>( j + 1 \cdot )</td>
<td>( -B, \beta )</td>
<td></td>
</tr>
</tbody>
</table>
| \( j + 2 \cdot \) | \( -A, ((\alpha \cup \beta) - \{n\})^* \) s.t. \( n \in (\alpha \cup \beta) \) \( -I, i-(j + 1) \)

<table>
<thead>
<tr>
<th></th>
<th>( -A, {n} )</th>
<th>( HYP )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( i \cdot )</td>
<td>( \vdots )</td>
<td>( \vdots )</td>
</tr>
<tr>
<td>( j \cdot )</td>
<td>( B, \alpha )</td>
<td></td>
</tr>
<tr>
<td>( j + 1 \cdot )</td>
<td>( -B, \beta )</td>
<td></td>
</tr>
</tbody>
</table>
| \( j + 2 \cdot \) | \( A, ((\alpha \cup \beta) - \{n\})^* \) s.t. \( n \in (\alpha \cup \beta) \) \( -I, i-(j + 1) \)
How the Paradoxes of Implication are Blocked 2

1. \((A \land \neg A), \{1\} \quad Hyp\)

2. \(\neg B, \{2\} \quad Hyp\)

3. \((A \land \neg A), \{1\} \quad Reit, 1\)

4. \(A, \{1\} \quad \land E, 3\)

5. \(\neg A, \{1\} \quad \land E, 3\)

Can’t then apply \(\neg I\)

R is a paraconsistent logic:
a contradiction does not imply anything whatsoever.

Page 550
R Rule for $\forall I$

\begin{align*}
i. & \quad A_i, \alpha \\
 j. & \quad A_1 \lor \cdots \lor A_i \lor \cdots \lor A_n, \alpha \quad \forall I, i
\end{align*}
R Rule for $\lor E$

\[ i_1. \quad A_1 \lor \cdots \lor A_n, \alpha \]
\[ \vdots \]
\[ i_2. \quad A_1 \implies B, \beta \]
\[ \vdots \]
\[ i_3. \quad A_n \implies B, \beta \]

\[ j. \quad B, \alpha \cup \beta \quad \lor E, i_1, i_2, i_3 \]
Irrelevance of Disjunctive Syllogism

\[
((A \lor B) \land \neg A), \{1\} \quad \text{Hyp}
\]

\[
\neg A, \{1\} \quad \land E,1
\]

\[
(A \lor B), \{1\} \quad \land E,1
\]

\[
A, \{2\} \quad \text{Hyp}
\]

\[
\neg B, \{3\} \quad \text{Hyp}
\]

\[
A, \{2\} \quad \text{Reit, 4}
\]

\[
\neg A, \{1\} \quad \text{Reit, 2}
\]

\[
B \quad \neg I, 5–7 \quad \text{Not valid in R}
\]

\[
A \Rightarrow B \quad \Rightarrow I, 4–8
\]

\[
B, \{4\} \quad \text{Hyp}
\]

\[
B, \{4\} \quad \text{Rep, 10}
\]

\[
B \Rightarrow B, \{\} \quad \Rightarrow I, 10–11
\]

\[
B \quad \lor E, 3,9,12
\]

So \(\lor\) is just truth-functional.

Page 553
R Rules for Intensional OR ($\oplus$)

\[
\begin{align*}
  i. \quad & (-A \Rightarrow B), \alpha \\
  j. \quad & (-B \Rightarrow A), \alpha \\
  j + 1. \quad & (A \oplus B), \alpha \quad \oplus I, i, j
\end{align*}
\]

\[
\begin{align*}
  i. \quad & (A \oplus B), \alpha \\
  j. \quad & \neg A, \beta \\
  j + 1. \quad & B, \alpha \cup \beta \quad \oplus E
\end{align*}
\]

\[
\begin{align*}
  i. \quad & (A \oplus B), \alpha \\
  j. \quad & \neg B, \beta \\
  j + 1. \quad & A, \alpha \cup \beta \quad \oplus E
\end{align*}
\]
R Rules for ⇔

i. \((A \Rightarrow B), \alpha\)

\vdots

j. \((B \Rightarrow A), \alpha\)

j + 1. \((A \Leftrightarrow B), \alpha \Leftrightarrow I, i, j\)

i. \(A, \alpha\)

\vdots

j. \((A \Leftrightarrow B), \beta\)

j + 1. \(B, \alpha \cup \beta \Leftrightarrow E, i, j\)

i. \(B, \alpha\)

\vdots

j. \((A \Leftrightarrow B), \beta\)

j + 1. \(A, \alpha \cup \beta \Leftrightarrow E, i, j\)
R Rules for ∀

\[ i. \quad \frac{A(a), \{n\}}{\text{Hyp}} \]

\[ j. \quad B(a), \alpha \text{ s.t. } n \in \alpha \]

\[ j + 1. \quad \forall x (A(x) \Rightarrow B(x)), \alpha - \{n\} \quad \forall I, i-j \]

\[ i. \quad \frac{A(t), \alpha}{\vdots} \]

\[ j. \quad \forall x (A(x) \Rightarrow B(x)), \beta \]

\[ j + 1. \quad B(t), \alpha \cup \beta \quad \forall E, i, j \]

Where \( a \) is an arbitrary individual not otherwise used in the proof, and \( t \) is free for \( x \) in \( B(x) \).

Note \( \forall \) only governs \( \Rightarrow \).
### R Rules for $\exists$

<table>
<thead>
<tr>
<th>$i$</th>
<th>$\exists x A(x), \alpha$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$i$</td>
<td>$A(t), \alpha$</td>
</tr>
<tr>
<td>$i + 1$</td>
<td>$\exists x A(x), \alpha \ \exists I, i$</td>
</tr>
<tr>
<td>$j$</td>
<td>$A{a/x}, \beta \ \text{Indef I, i}$</td>
</tr>
<tr>
<td></td>
<td>$\vdots$</td>
</tr>
<tr>
<td>$k$</td>
<td>$B, \gamma \ s.t. \ \beta \subset \gamma$</td>
</tr>
<tr>
<td>$k + 1$</td>
<td>$B, \gamma - \beta \ \exists E, j-k$</td>
</tr>
</tbody>
</table>

Where $A(x)$ is the result of replacing some or all occurrences of $t$ in $A(t)$ by $x$,
t is free for $x$ in $A(x)$;
a is an indefinite individual not otherwise used in the proof,
$A(a/x)$ is the result of replacing all occurrences of $x$ in $A(x)$ by $a$,
and there is no occurrence of $a$ in $B$. 

Page 557
Why the Subproof Contours?

1. To keep track of assumptions for each derived wff. But this is accomplished by os.

2. To differentiate hypotheses from derived wffs.
   Introduce support: $\langle\{hyp \mid der \mid ext\}, os\rangle$
   with origin tag and origin set.
The SNePS KB consists of a collection of supported wffs. A wff may have more than one support if it was derived in multiple ways. Every implemented rule of inference specifies how the derived wff is derived from its parent(s) and how its support is derived from the support(s) of its parent(s).
A context is a set of hypotheses.

A belief space defined by a context $c$ is the set containing every wff whose os is a subset of $c$. 
SNePSLOG Example

\ <\text{hyp},\{\text{wff5}\}>

wff1!: \text{OnFloor}(1) \ <\text{hyp},\{\text{wff1}\}>

Page 563
: perform disbelieve(OnFloor(1))

: describe-context
((assertions (wff9 wff7 wff5)) (named (default-defaultct))
 (kinconsistent nil))

: list-asserted-wffs
wff9!: {OnFloor(4),OnFloor(3)} v=> {Location(aboveGround)}
  {<hyp,{wff9}>}
wff7!: {OnFloor(2),OnFloor(1)} v=> {Location(belowGround)}
  {<hyp,{wff7}>}
wff5!: xor{OnFloor(4),OnFloor(3),OnFloor(2),OnFloor(1)}
  {<hyp,{wff5}>}

Page 564
SNePSLOG Example of $\neg I$

\[
\begin{align*}
\text{wff5!}: & \quad \text{BearYoung(whales, live)} \quad \{\text{hyp,\{wff5\}}\} \\
\text{wff4!}: & \quad \text{LiveIn(whales, water)} \quad \{\text{hyp,\{wff4\}}\} \\
\text{wff3!}: & \quad \text{all}(x)(\text{BearYoung}(x, \text{live}) \Rightarrow \text{Ako}(x, \text{mammal})) \quad \{\text{hyp,\{wff3\}}\} \\
\text{wff2!}: & \quad \text{all}(x)(\text{LiveIn}(x, \text{water}) \Rightarrow \text{Ako}(x, \text{fish})) \quad \{\text{hyp,\{wff2\}}\} \\
\text{wff1!}: & \quad \text{all}(x)(\text{nand}\{\text{Ako}(x, \text{fish}), \text{Ako}(x, \text{mammal})\}) \quad \{\text{hyp,\{wff1\}}\}
\end{align*}
\]
: Ako(whales, ?x)?

A contradiction was detected within context default-defaultct. The contradiction involves the newly derived proposition:

\[ \text{wff8!}: \ Ako(\text{whales}, \text{mammal}) \ \{<\text{der}, \{\text{wff3}, \text{wff5}\}>}\]

and the previously existing proposition:

\[ \text{wff9!}: \ \neg Ako(\text{whales}, \text{mammal}) \ \{<\text{der}, \{\text{wff1}, \text{wff2}, \text{wff4}\}>}\]

...

In order to make the context consistent you must delete at least one hypothesis from each of the following sets of hypotheses:

(wff5 wff4 wff3 wff2 wff1)
The Culprit Set

1 : wff5!: BearYoung(whales,live)  {<hyp,{wff5}>}
   (2 supported propositions: (wff8 wff5) )

2 : wff4!: LiveIn(whales,water)  {<hyp,{wff4}>}
   (3 supported propositions: (wff9 wff7 wff4) )

3 : wff3!: all(x)(BearYoung(x,live) => Ako(x,mammal))  {<hyp,{wff3}>}
   (2 supported propositions: (wff8 wff3) )

4 : wff2!: all(x)(LiveIn(x,water) => Ako(x,fish))  {<hyp,{wff2}>}
   (3 supported propositions: (wff9 wff7 wff2) )

5 : wff1!: all(x)(nand{Ako(x,fish),Ako(x,mammal)})
          {<hyp,{wff1}>}
   (2 supported propositions: (wff9 wff1) )

Page 567

\[ wff1!: \text{all}(x)(\text{nand}\{\text{Ako}(x,\text{fish}),\text{Ako}(x,\text{mammal})\}) \]
\[ \{\text{hyp},\{wff1\}\} \]
10 The Situation Calculus
Motivation (McCarthy)

I’m in my study at home. My car is in the garage. I want to get to the airport. How do I decide that I should walk to the garage and drive to the airport, rather than vice versa?

A commonsense planning problem.
Solution Sketch

My study and garage are in my home.
To get from one place to another in my home, I should walk.

My garage and the airport are in the county.
To get from one place to another in the county, I should drive.
Situations

When an agent acts, some propositions change as a result of acting, and some are independent of acting.

E.g. the fact that the airport is in the county is independent of my acting, but whether I’m in my study, in the garage, or at the airport, changes when I act.

We say that an act takes us from one situation to another.

Propositions that are dependent on situations are called propositional fluents. E.g. \( At(study, S0), At(garage, S1) \) vs. \( In(study, home), In (airport, county) \)
Situational Fluents

We can view an act as something that’s done in some situation, and takes us to another situation.

Let $do(a, s)$ be a two-argument functional term.

$[do(a, s)] = \text{the situation that results from doing the act } [a] \text{ in the situation } [s].$

So, $At(\text{study}, S0), At(\text{garage}, do(\text{walk(study, garage)}, S0))$
Planning in the Situational Calculus

Describe the situation $S0$.
Give domain rules describing the effects of actions.
Find a solution for $At(airport, ?s)$
Formalization in SNARK
Non-Fluent Propositions

(assert '(Walkable home))
(assert '(Drivable county))
(assert '(In study home))
(assert '(In garage home))
(assert '(In garage county))
(assert '(In airport county))
Effect Axioms

(assert '(all (x y z s)
            (=> (and (At x s) (In x z) (In y z)
                  (Walkable z))
                 (At y (do (walk x y) s)))))

(assert '(all (x y z s)
            (=> (and (At x s) (In x z) (In y z)
                  (Drivable z))
                 (At y (do (drive x y) s)))))

Initial Situation

(assert '(At study S0))
SNARK Solves the Problem

(query "How do you go to the airport?"
  '(At airport ?s)
  :answer '(By doing ?s))

How do you go to the airport?
(ask '(At airport ?s))
  = (At airport (do (drive garage airport)
                     (do (walk study garage) S0)))
Example 2: BlocksWorld
Domain Axioms

(assert '(all s (Clear Table s)))

(assert '(all (x y s) (=> (and (Block y) (On x y s))
 (not (Clear y s)))))

(assert '(all (x s) (=> (Held x s)
 (not (Clear x s)))))
BlocksWorld Effect Axioms

(assert
  '(all (x y s) (=> (and (On x y s) (Clear x s))
               (and (Held x (do (pickUp x) s))
                    (Clear y (do (pickUp x) s))))))

(assert
  '(all (x y s) (=> (and (Held x s) (Clear y s))
               (and (On x y (do (putOn x y) s))
                    (not (Held x (do (putOn x y) s)))))
               (Clear x (do (putOn x y) s))))

Page 579
Initial Situation

(assert '(Block A))
(assert '(Block B))
(assert '(Block C))
(assert '(On A B S0))
(assert '(On B Table S0))
(assert '(On C Table S0))
(assert '(Clear A S0))
(assert '(Clear C S0))
(query "How do you achieve holding Block A?"
   '(Held A ?s)
   :answer '(By doing ?s))

How do you achieve holding Block A?
(ask '(Held A ?s)) = (By doing (do (pickUp A) S0))
A Harder Problem

(query "How do you put Block A on Block C"  
' (On A C ?s)  
:answer '(By doing ?s))

Just loops!
The Frame Problem

We want

\[(\text{On} \ A \ C \ (\text{do} \ (\text{putOn} \ A \ C) \ (\text{do} \ (\text{pickUp} \ A) \ S0)))\]

but this requires C to be clear in situation

\[(\text{do} \ (\text{pickUp} \ A) \ S0)\]

That can’t be decided.

We need to specify what propositional fluents *don’t change* when an action is performed.
A Frame Axiom

(assert
    '(all (x y s) (=> (and (Clear x s) (not (= x y)))
    (Clear x (do (pickUp y) s)))))
Another Problem

Still doesn’t work, because we don’t know that

(not (= C A))
Unique Names Axioms

(assert '(not (= A B)))
(assert '(not (= A C)))
(assert '(not (= B C)))

Also need

(use-paramodulation)

after (initialize)

This includes the theory of equality with resolution.
Success!

(query "How do you put Block A on Block C" '(On A C ?s)
  :answer '(By doing ?s))

How do you put Block A on Block C
(ask '(On A C ?s))
  = (By doing (do (putOn A C) (do (pickUp A) S0))))
11 Summary

**Artificial Intelligence (AI):** A field of computer science and engineering concerned with the computational understanding of what is commonly called intelligent behavior, and with the creation of artifacts that exhibit such behavior.

**Knowledge Representation and Reasoning (KR or KRR):**
A subarea of Artificial Intelligence concerned with understanding, designing, and implementing ways of representing information in computers, and using that information to derive new information based on it.

KR is more concerned with belief than “knowledge”. Given that an agent (human or computer) has certain beliefs, what else is reasonable for it to believe, and how is it reasonable for it to act, regardless of whether those beliefs are true and justified.
What is Logic?

• **Logic** is the study of correct reasoning.

• There are many systems of logic (logics). Each is specified by specifying:
  
  – Syntax: Specifying what counts as a well-formed expression
  
  – Semantics: Specifying the meaning of well-formed expressions
    
    * Intensional Semantics: Meaning relative to a Domain
    
    * Extensional Semantics: Meaning relative to a Situation
  
  – Proof Theory: Defining proof/derivation, and how it can be extended.
KR and Logic

Given that a Knowledge Base is represented in a language with a well-defined syntax, a well-defined semantics, and that reasoning over it is a well-defined procedure, a KR system is a logic.

KR research can be seen as a search for the best logic to capture human-level reasoning.
## Proof Theory and Semantics

Page 591
Inference/Reasoning Methods

Given a KB/set of assumptions $\mathcal{A}$ and a query $\mathcal{Q}$:

- Model Finding
  - Direct: Find satisfying models of $\mathcal{A}$; see if $\mathcal{Q}$ is true in all of them.
  - Refutation: Find if $\mathcal{A} \cup \{\neg \mathcal{Q}\}$ is unsatisfiable.

- Natural Deduction
  - Direct: Find if $\mathcal{A} \vdash \mathcal{Q}$.

- Resolution
  - Direct: Find if $\mathcal{A} \vdash \mathcal{Q}$ (incomplete).
  - Refutation: Find if $\mathcal{A} \land \neg \mathcal{Q}$ is inconsistent.
Logics We Studied

1. Standard Propositional Logic
2. Clause Form Propositional Logic
3. Standard Finite-Model Predicate Logic
4. Clause Form Finite-Model Predicate Logic
5. Standard First-Order Predicate Logic
6. Clause Form First-Order Predicate Logic
7. Horn Clause Logic
8. Relevance Logic
9. SNePSLOG & SNeRE
10. The Situation Calculus
11. Description Logics
Classes of Logics

• Propositional Logic
  – Finite number of atomic propositions and models.
  – Model finding and resolution are decision procedures.

• Finite-Model Predicate Logic
  – Finite number of terms, atomic formulae, and models.
  – Reducible to propositional logic.
  – Model finding and resolution are decision procedures.

• First-Order Logic
  – Infinite number of terms, atomic formulae, and models.
  – Not reducible to propositional logic.
  – There are no decision procedures.
  – Resolution plus factoring is refutation complete.
Proof Procedures We Studied

1. Direct model finding: truth tables, decreasoner, relsat (complete search) walksat, gsat (stochastic search)
2. Wang algorithm (model-finding refutation), wang
3. Semantic tableaux (model-finding refutation)
4. Hilbert-style axiomatic (direct), brief
5. Fitch-style natural deduction (direct)
6. Resolution (refutation), prover, SNARK
7. SLD resolution (refutation), Prolog
8. SNePS (direct), SNePS
Utility Notions and Techniques

1. Material implication

2. Possible properties of connectives
   commutative, associative, idempotent

3. Possible properties of well-formed expressions
   free, bound variables
   open, closed, ground expressions

4. Possible semantic properties of wffs
   contradictory, satisfiable, contingent, valid

5. Possible properties of proof procedures
   sound, consistent, complete,
   decision procedure, semi-decision procedure
More Utility Notions and Techniques

5. Substitutions
   application, composition

6. Unification
   most general common instance (mgci),
   most general unifier (mgu)

7. Translation from standard form to clause form
   Conjunctive Normal Form (CNF),
   Skolem functions/constants

8. Resolution Strategies
   subsumption, unit preference, set of support

9. The Answer Literal
Yet More Utility Notions and Techniques

9. Closed vs. Open World Assumption
10. Negation by failure
11. Origin sets, contexts
12. Belief Revision/Truth-Maintenance
Domain Modeling

1. Formalization in various logics

2. Reification

3. Ontologies/Taxonomies/Hierarchies
   - extensional vs. intensional
   - instance vs. subcategory
   - Single (DAGs) vs multiple inheritance
   - transitive relations/transitive closure
   - mutually exclusive/disjoint categories
   - exhaustive set of subcategories
   - partitioning of a category
More Domain Modeling

4. Time
   • subjective vs. objective
   • points vs. intervals
   • Allen’s relations

5. Things (Count Nouns) vs. Substances (Mass Nouns)

6. Acting
   • situations
   • fluents
12 Production Systems

Architecture

Working (Short-term) Memory

Contains set (unordered, no repeats) of Working Memory Elements (WMEs).
Each being a rather flat, ground (no variables) symbol structure.
Rule (Long-term) Memory

Contains set (unordered, no repeats) of Production Rules. Each being a condition-action rule of form

\textbf{if} condition_1 \ldots condition_n \textbf{then} action_1 \ldots action_m

Each condition and action being like a WME, but allowing variables (and, maybe, other expressions)
A rule \texttt{if condition}_1 \ldots \texttt{condition}_n \texttt{then action}_1 \ldots \texttt{action}_m

is triggered

if there is a substitution, $\sigma$

such that each condition$_i \sigma$ is a WME.

A single rule can be triggered in multiple ways (by multiple substitutions).
Rule Firing

A rule if condition₁ ... conditionₙ then action₁ ... actionₘ that is triggered in a substitution σ fires by performing every actionᵢσ.
Production System Execution Cycle

loop

Collect $\mathcal{T} = \{r\sigma \mid r\sigma \text{ is a triggered rule}\}$

if $\mathcal{T}$ is not empty

Choose a $r\sigma \in \mathcal{T}$

Fire $r\sigma$

until $\mathcal{T}$ is empty.
Some Typical Actions

- stop
- delete a WME
- add a WME
- modify a WME
- formatted print
Conflict Resolution Strategies

Purpose: to “Choose a \( r \sigma \in \mathcal{T} \)”

Specificity: If the conditions of one rule are a subset of a second rule, choose the second rule. [B & L, p. 126]

Recency: Based on recency of addition or modification of WMEs, or on recency of a rule firing. [B & L, p. 126]

Refactoriness: Don’t allow the same substitution instance of a rule to fire again. [B & L, p. 127]

The Rete Algorithm
Assumptions

Rule memory doesn’t change.
WM changes only slightly on each cycle.
WMEs are ground.
Production Systems are data-driven (use forward chaining).
Many rules share conditions.
The Rete Network

Create a network from the conditions (Like a discrimination tree) with rules at the leaves.

Create a token for each WME.

Pass each token through the network, stopping when it doesn’t satisfy a test; resuming when the WME is modified.

When tokens reach a leaf, the rule is triggered.

Kinds of branch nodes

$\alpha$ nodes: Simple test.

$\beta$ nodes: Constraints caused by different conditions.
13 Description Logics

Main reference:
DL: Main Ideas

• Terminological Box or T-Box.
  \textbf{Definition} of \textit{Concepts} ("Classes") and \textit{Roles} ("Properties").

• Assertional Box or A-Box.
  Assertions about individuals (instances)
  –Unary predicates = concepts
  –Binary predicates = roles

• Necessary and Sufficient conditions on classes.

• Subsumption Hierarchy
Syntax of a Simple DL

Atomic Symbols

- Positive integers: 1, 2, 3
- Atomic concepts: Thing, Pizza, PizzaTopping, PizzaBase
  Thing is the top of the hierarchy.
- Roles: hasTopping, hasBase
- Constants: item1, item2

Page 612

Syntax of a Simple DL

Concepts

• Every atomic concept is a concept

• If \( r \) is a role and \( d \) is a concept, \([\text{ALL} \ r \ d]\) is a concept.
  The concept of individuals all of whose \( r \)'s are \( d \)'s.
  E.g., \([\text{ALL} \ \text{hasTopping} \ \text{VegetarianTopping}]\)

• If \( r \) is a role and \( n \) is a positive integer, \([\text{EXISTS} \ n \ r]\) is a concept.
  The concept of individuals that have at least \( n \) \( r \)'s.
  E.g., \([\text{EXISTS} \ 1 \ \text{hasTopping}]\)

• If \( r \) is a role and \( c \) is a constant, \([\text{FILLS} \ r \ c]\) is a concept.
  The concept of individuals one of whose \( r \)'s is \( c \).
  E.g., \([\text{FILLS} \ \text{hasTopping} \ \text{item2}]\)

• If \( d_1, \ldots, d_n \) are concepts, \([\text{AND} \ d_1, \ldots, d_n]\) is a concept
  The concept that is the intersection of \( d_1, \ldots, d_n \).
  E.g., \([\text{AND} \ \text{Pizza} [\text{EXISTS} \ 1 \ \text{hasTopping}]\]
                  \( [\text{ALL} \ \text{hasTopping} \ \text{VegetarianTopping}]\)]
Syntax of a Simple DL Sentences

- If \( d_1 \) and \( d_2 \) are concepts, \((d_1 \sqsubseteq d_2)\) is a sentence. 
  \(d_1\) is subsumed by \(d_2\)
  E.g., VegetarianPizza \(\sqsubseteq\) Pizza

- If \( d_1 \) and \( d_2 \) are concepts, \((d_1 \equiv d_2)\) is a sentence.
  \(d_1\) and \(d_2\) are equivalent
  E.g., VegetarianPizza \(\equiv\) [AND Pizza [EXISTS 1 hasTopping] [ALL hasTopping VegetarianTopping]]

- If \( c \) is a constant and \( d \) is a concept, \((c \rightarrow d)\) is a sentence.
  The individual \(c\) satisfies the description expressed by \(d\).
  E.g., item1 \(\rightarrow\) Pizza
Necessary and Sufficient Conditions

A necessary condition on a class, \( d \), is a property, \( p \), such that if an individual, \( c \), is an instance of \( d \), it is necessary that \( c \) satisfy \( p \).

A sufficient condition on a class, \( d \), is a property, \( p \), such that if an individual, \( c \), satisfies \( p \), then that is a sufficient reason to decide that it is an instance of \( d \).

A defined concept has both necessary and sufficient conditions.

A primitive concept has only necessary conditions.
Subsumption Hierarchy

\[ d_1 \sqsubseteq d_2 \]

\( d_1 \) is subsumed by \( d_2 \)

E.g., VegetarianPizza \( \sqsubseteq \) Pizza

means that every instance of \( d_1 \) is an instance of \( d_2 \).

Every DL concept is subsumed by Thing, the top of the hierarchy.
Classification Algorithm

Decision procedure for placing every defined concept correctly in the subsumption hierarchy.

Note: Two concepts that subsume each other are the same.

Note: No concept can be computed as being subsumed by a primitive concept.

Page 626
14 Abduction

Abduction is the non-sound inference

from

$P \Rightarrow Q$

and $Q$

to

$P$

See Brachman & Levesque, Chapter 13.
Some Uses of Abduction

1. Explanation
   from $\text{It's raining} \Rightarrow \text{The grass is wet}$
   and $\text{The grass is wet}$ to $\text{It's raining}$

2. Diagnosis
   from $\text{Infection} \Rightarrow \text{Fever}$
   and $\text{Fever}$ to $\text{Infection}$

3. Plan Recognition
   from $\text{Cooking pasta} \Rightarrow \text{Boil water}$
   and $\text{Boil water}$ to $\text{Cooking pasta}$

4. Text Understanding
   from $\forall x(\text{gotGoodService}(x) \Rightarrow \text{leftBigTip}(x))$
   and $\text{Betty left a big tip.}$ to $\text{Betty got good service.}$

Page 628
Prime Implicates

Applies to KRR using resolution.

For some KB and some clause $C$, if
KB $\models C$
and for any $C'$ s.t. $C'$ is a proper subset of $C$
KB $\not\models C'$
$C$ is a prime implicate of KB.
Example of Computing Prime Implicate

prover(4): (prove ’((=> (and p q r) g)
    (=> (and (not p) q) g)
    (=> (and (not q) r) g))
  ’g)

7 ((not p) (not q) (not r)) R,4,3,{} Subsumed
8 ((not r) p) R,5,6,{} Subsumed
11 ((not q) (not r)) R,7,8,{} Subsumed
12 ((not r)) R,11,6,{}

Example from Brachman & Levesque, p 271.

Page 630
Example 2

prover(8): (prove '((forall x (=> (enterRestaurant x) (beSeated x)))
(foreAll x (=> (beSeated x) (beServed x)))
(foreAll x (=> (beServed x) (getFood x)))
(foreAll x (=> (getFood x) (eatFood x)))
(foreAll x (=> (eatFood x) (and (pay x) (leaveTip x)))))
(foreAll x (=> (gotGoodService x) (leftBigTip x)))
(enterRestaurant Betty))
'(leftBigTip Betty))

1 ((enterRestaurant Betty)) Assumption
2 ((not (enterRestaurant ?1)) (beSeated ?1)) Assumption
3 ((not (beSeated ?3)) (beServed ?3)) Assumption
4 ((not (beServed ?5)) (getFood ?5)) Assumption
5 ((not (getFood ?7)) (eatFood ?7)) Assumption
6 ((not (eatFood ?9)) (pay ?9)) Assumption
7 ((not (eatFood ?10)) (leaveTip ?10)) Assumption
8 ((not (gotGoodService ?12)) (leftBigTip ?12)) Assumption
9 ((not (leftBigTip Betty)) (Answer (leftBigTip Betty))) From Query
10 ((not (gotGoodService Betty))
    (Answer (leftBigTip Betty))) R,9,8,{Betty/?12}

nil

I.e., (=> (gotGoodService Betty) (leftBigTip Betty))
Interpretation

Possible interpretations of
(=> (gotGoodService Betty) (leftBigTip Betty)):

1. Abduction: Since (leftBigTip Betty),
   infer (gotGoodService Betty).

2. Diagnosis: Since (not (leftBigTip Betty)),
   infer (not (gotGoodService Betty)).

3. Hypothetical Answer: If (gotGoodService Betty)
   then (leftBigTip Betty).

4. Why Not: Didn’t infer (leftBigTip Betty)
   because didn’t know (gotGoodService Betty).
